Soft Computing-based Methods for Semantic Service Retrieval

Supannada Chotipant

FACULTY OF ENGINEERING AND INFORMATION TECHNOLOGY
UNIVERSITY OF TECHNOLOGY SYDNEY

A thesis submitted in fulfilment of the requirements for
the degree of Doctor of Philosophy

July 2017
CERTIFICATE OF ORIGINAL AUTHORSHIP

I certify that the work in this thesis has not previously been submitted for a degree nor has it been submitted as part of requirements for a degree except as fully acknowledged within the text.

I also certify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

Signature: ..............................................................................................................

Date: ....................................................................................................................
ACKNOWLEDGEMENT

First of all, I would like to express my sincere gratitude to my principle supervisor, Dr Farookh Khadeer Hussain. My priceless journey started when he accepted me to be his PhD student in August 2013. He has given me not only excellent guidance in my research, but also great support and encouragement. This really helps me to finish my research and learn how to be a good researcher.

Additionally, I would like to thank my parents who always stand beside me and walk through all bad situations with me. I am who I am because of them, so it is undoubtedly that this success also belongs to my parents. I cannot be here without their endless care, support, and encouragement. Likewise, I would like to thank my family, Prof. Tony Moon, and my friends who always help me to get over all the bad situations.

Finally, I dedicate this thesis to Dr Farookh Khadeer Hussain, who is a key person of this work, my parents, and my family.
ABSTRACT

Nowadays, a large number of business services have been advertised to customers via online channels. To access the published services, the customers typically search for the services by using search engines. Consequently, in order to meet the customers' desires, many researchers have focused on improving performance of the retrieval process. In the recent past, semantic technologies have played an important role in service retrieval and service querying. A service retrieval system consists of two main processes; service annotation and service querying. Annotating services semantically enables machines to understand the purpose of services, while semantic service querying helps machines to expand user queries by considering meanings of query terms, and retrieve services which are relevant to the queries. Because of dealing with semantics of services and queries, both processes can further assist in intelligent and precise service retrieval, selection and composition. In terms of semantic service annotation, a key issue is the manual nature of service annotation. Manual service annotation requires not just large amount of time, but updating the annotation is infrequent and, hence, annotation of the service description changes may be out-of-date. Although some researchers have studied semantic service annotation, they have focused only on Web services, not business service information. Moreover, their approaches are semi-automated, so service providers are still required to select appropriate service annotations. Similar to semantic service annotation, existing literature in semantic service querying has focused on processing Web pages or Web services, not business service information. In addition, because of issues of ubiquity, heterogeneity, and ambiguity of services, the use of soft computing methods offers an interesting solution for handling complex tasks in service retrieval. Unfortunately, based on the literature review, no soft-computing based methods have been used for semantic service annotation or semantic service querying. In this research, intelligent soft-computing driven methods are developed to improve the performance of a semantic retrieval system for business services. The research includes three main parts, namely, intelligent methods for semantically annotating services, querying service concepts, and retrieving services based on relevant concepts. Furthermore, a prototype of a service
retrieval system is built to validate the developed intelligent methods. The research proposes three semantic-based methods; ECBR, Vector-based and Classification-based, for accomplishing each research part. The experimental results present that the Classification-based method, which is based on soft-computing techniques, performs well in the service annotation and outperforms both the ECBR and the Vector-based methods in the service querying and service retrieval.

Table A.38 The experiments of RBF-based approach with QE-2 for single-label service querying ................................................................. 270
Table A.39 The experiments of RBF-based approach with QE-3 for single-label
service querying ....................................................................................................... 270
Table A.40 The experiments of RBF-based approach with QE-4 for single-label
service querying ....................................................................................................... 270
Table A.41 The experiments of RBF-based approach with QE-5 for single-label
service querying ....................................................................................................... 271
Table A.42 The experiments of RBF-based approach with QE-6 for single-label
service querying ....................................................................................................... 271
Table A.43 The experiments of RBF-based approach without query expansion for
multi-label service querying .................................................................................... 272
Table A.44 The experiments of RBF-based approach with QE-1 for multi-label
service querying ....................................................................................................... 272
Table A.45 The experiments of RBF-based approach with QE-2 for multi-label
service querying ....................................................................................................... 272
Table A.46 The experiments of RBF-based approach with QE-3 for multi-label
service querying ....................................................................................................... 273
Table A.47 The experiments of RBF-based approach with QE-4 for multi-label
service querying ....................................................................................................... 273
Table A.48 The experiments of RBF-based approach with QE-5 for multi-label
service querying ....................................................................................................... 274
Table A.49 The experiments of RBF-based approach with QE-6 for multi-label
service querying ....................................................................................................... 274
Table A.50 The experiments of KNN-based approach without query expansion for
single-label service querying ................................................................................... 275
Table A.51 The experiments of KNN-based approach with QE-1 for single-label
service querying ....................................................................................................... 275
Table A.52 The experiments of KNN-based approach with QE-2 for single-label
service querying ....................................................................................................... 276
Table A.53 The experiments of KNN-based approach with QE-3 for single-label
service querying ....................................................................................................... 276
Table A.54 The experiments of KNN-based approach with QE-4 for single-label
service querying ....................................................................................................... 276
Table A.55 The experiments of KNN-based approach with QE-5 for single-label service querying ................................................................. 277
Table A.56 The experiments of KNN-based approach with QE-6 for single-label service querying ................................................................. 277
Table A.57 The experiments of KNN-based approach without query expansion for multi-label service querying ................................................................. 278
Table A.58 The experiments of KNN-based approach with QE-1 for multi-label service querying ................................................................. 278
Table A.59 The experiments of KNN-based approach with QE-2 for multi-label service querying ................................................................. 278
Table A.60 The experiments of KNN-based approach with QE-3 for multi-label service querying ................................................................. 279
Table A.61 The experiments of KNN-based approach with QE-4 for multi-label service querying ................................................................. 279
Table A.62 The experiments of KNN-based approach with QE-5 for multi-label service querying ................................................................. 279
Table A.63 The experiments of KNN-based approach with QE-6 for multi-label service querying ................................................................. 280
Table B.1 The experiments of ECBR approach for a single-label fuzzy service retrieval ($RT=0.6$) .................................................................................. 285
Table B.2 The experiments of ECBR approach for a multi-label fuzzy service retrieval ($RT=0.8$) .................................................................................. 285
Table B.3 The experiments of ECBR approach for a combine-label fuzzy service retrieval ($RT=0.8$) .................................................................................. 285
Table B.4 The experiments of VSM-based approach for a single-label fuzzy service retrieval ($RT=0.9$) .................................................................................. 286
Table B.5 The experiments of VSM-based approach for a multi-label fuzzy service retrieval ($RT=0.9$) .................................................................................. 286
Table B.6 The experiments of VSM-based approach for a combine-label fuzzy service retrieval ($RT=0.9$) .................................................................................. 286
Table B.7 The experiments of EVSM-based approach for a single-label fuzzy service retrieval ($RT=0.9$) .................................................................................. 287
Table B.8 The experiments of EVSM-based approach for a multi-label fuzzy service retrieval \((RT=0.9)\) .................................................................................................................. 287
Table B.9 The experiments of EVSM-based approach for a combine-label fuzzy service retrieval \((RT=0.9)\) .................................................................................................................. 287
Table B.10 The experiments of FF-based approach for a single-label fuzzy service retrieval \((AN=90, \, QN=30)\) ........................................................................................................ 288
Table B.11 The experiments of FF-based approach for a multi-label fuzzy service retrieval \((AN=10, \, QN=30)\) ........................................................................................................ 288
Table B.12 The experiments of FF-based approach for a multi-label fuzzy service retrieval \((AN=60, \, QN=30)\) ........................................................................................................ 288
Table B.13 The experiments of FF-based approach for a combine-label fuzzy service retrieval \((AN=90, \, QN=30)\) ........................................................................................................ 289
Table B.14 The experiments of RBF-based approach for a single-label fuzzy service retrieval \((AS=0.6, \, QS=0.4)\) ........................................................................................................ 289
Table B.15 The experiments of RBF-based approach for a multi-label fuzzy service retrieval \((AS=0.8, \, QS=0.9)\) ........................................................................................................ 289
Table B.16 The experiments of RBF-based approach for a combine-label fuzzy service retrieval \((AS=0.6, \, QS=0.9)\) ........................................................................................................ 290
Table B.17 The experiments of KNN-based approach for a single-label fuzzy service retrieval \((AK=3, \, QK=1)\) ........................................................................................................ 290
Table B.18 The experiments of KNN-based approach for a multi-label fuzzy service retrieval \((AK=1, \, QK=9)\) ........................................................................................................ 290
Table B.19 The experiments of KNN-based approach for a combine-label fuzzy service retrieval \((AK=1, \, QK=9)\) ........................................................................................................ 291
Table B.20 The experiments of CT-based approach for a single-label fuzzy service retrieval .................................................................................................................. 291
Table B.21 The experiments of CT-based approach for a multi-label fuzzy service retrieval .................................................................................................................. 291
Table B.22 The experiments of CT-based approach for a combine-label fuzzy service retrieval .................................................................................................................. 291
Table B.23 The experiments of SVM-based approach for a multi-label fuzzy service retrieval .................................................................................................................. 292
