Submitted in fulfilment of the requirements of the degree of Doctor of Philosophy

CERTIFICATE OF ORIGINAL AUTHORSHIP

I, Sharon Maree Bowen declare that this thesis, is submitted in fulfilment of the requirements for the award of Doctor of Philosophy, in the School of Life Sciences, Faculty of Science, at the University of Technology Sydney.

The thesis is wholly my own work unless otherwise referenced or acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

This document has not been submitted for qualifications at any other academic institution.

This research has been supported by the Australian Government Research Training Program.

Production Note:

Signature: Signature removed prior to publication.

Date: 14-08-2019

Acknowledgments

I would like to acknowledge the assistance I have received from some outstanding staff of the NSW Office of Environment and Heritage, most particularly Shannon Simpson, Darren Shelly, Jane Humphries, Tim Hosking, Paul Keyte, Terry Mazzer, Wayne Kuo and Joel Honeysett. I am also grateful for the invaluable support I have received from Dr Mike Maher, Dr Lisa Thurtell, Graeme Enders and Daryl Albertson. Thanks to the all the landholders and land managers of the Macquarie Marshes for their support for this work over the years.

I am grateful to my PhD supervisors; Dr Fraser Torpy, Professor Margaret Burchett, Dr Yoshi Kobayashi and Dr Patrick Driver. Thank you for your guidance.

To my family; Peter, Emma, Cara and Sam Bowen, thank you for all your support and for encouraging me in this long and arduous task.

Funding for this work came from several sources including the NSW and Australian Governments' Water for the Future Program and the Australian Governments' Murray-Darling Basin Plan implementation funding.

Thanks also to W.A. Mozart and ABC Classic FM.

Preface

This research outlines how to quantify measures of condition for flood-dependent plant communities in inland floodplain wetlands. This is critical for efficient ecological monitoring, use in predictive modelling, and to define vegetation restoration targets and management strategies for environmental water. This study has developed a quantitative framework for assessing flood-dependent vegetation community condition and has added to the empirical knowledge about the water requirements of these plant communities.

ABSTRACT	XVII
CHAPTER 1 INTRODUCTION	1
1.1. THE MURRAY-DARLING BASIN	1
1.2 INLAND FLOODPLAIN WETLANDS OF THE MURRAY DARLING BASIN	3
1.3 WATER AVAILABILITY IN THE MURRAY-DARLING BASIN	4
1.4 GOVERNANCE AND MANAGEMENT OF MURRAY-DARLING BASIN WATER RESOURCES	6
1.5 INLAND FLOODPLAIN WETLAND PLANT COMMUNITY RELATIONSHIPS WITH WATER.....	7
1.6 RESEARCH AIM	9
1.7 RESEARCH APPROACH	10
1.8 RESEARCH QUESTIONS	12
1.9 REVIEW OF INUNDATION REGIME REQUIREMENTS OF DOMINANT SPECIES OF INLAND FLOODPLAIN WETLAND PLANT COMMUNITIES IN THE MACQUARIE MARSHES.....	12
1.9.1 Flood-dependent woody communities.....	13
1.9.2 Non-woody wetland and understory species	14
1.10 CONCEPTUAL MODEL OF INLAND FLOODPLAIN WETLAND PLANT COMMUNITY CONDITION IN RESPONSE TO INUNDATION REGIME.....	19

1.11 THESIS OUTLINE.....	22
CHAPTER 2 MODELLING CONDITION RESPONSE VARIABLES OF INLAND FLOODPLAIN PLANT COMMUNITIES IN RELATION TO INUNDATION PREDICTOR VARIABLES	
2.1 INTRODUCTION.....	24
2.1.2 The Macquarie Marshes	25
2.1.3 History of change in water availability in the Macquarie Marshes	30
2.1.4 Water resource management in the Macquarie Marshes.....	32
2.1.5 Inland floodplain wetland plant communities in the Macquarie Marshes.....	33
2.2 METHODS	38
2.2.1 Measures used to assess plant community condition in NSW	38
2.2.2 Floristic community condition response variables to define benchmarks	39
2.2.3 Tree stand condition response variables to define benchmarks.....	44
2.2.4 Hypotheses – floristic condition	47
2.2.5 Hypotheses – tree stand condition.....	48
2.2.6 Survey design	48
2.2.7 Timing of sampling.....	51
2.2.8 Community condition survey.....	52
2.2.9 Tree stand condition survey	53
2.2.10 Annual inundation duration data	54
2.3 DATA ANALYSIS	54
2.3.1 Data preparation.....	54
2.3.2 Multivariate Regression Forests (MRF).....	56
2.3.3 Inundation variable importance for community condition variables	61
2.3.4 Inundation variable importance for tree stand condition variables.....	63
2.3.5 Deriving floristic community condition variable profiles.....	63
2.3.6 Deriving tree stand condition variable profiles	64
2.3.7 Predicting condition variable profiles under different inundation regimes	65

2.4 RESULTS.....	68
2.4.1 Floristic community survey	68
2.4.2 Inundation variable importance for community condition	72
2.4.3 Floristic community condition site clustering profiles by stratum	77
2.4.4 Modelling floristic community condition variable ranges under different inundation regimes by wetland type.....	89
2.4.5 Inundation variable importance for tree stand condition	95
2.4.6 Tree stand condition site clustering profiles	96
2.5 DISCUSSION.....	104
2.5.1 Floristic community condition response variable trends in relation to predictor variables	104
2.5.2 Tree stand condition response variable trends in relation to predictor variables	111
2.5.3 Key drivers of tree stand condition and tree wetland type distribution	114
2.5.4 Effect of grazing pressure	115
2.5.5 Drought management and building resilience.....	116
CHAPTER 3 DEFINING CONDITION CLASSES FOR KEY INLAND FLOODPLAIN WETLAND PLANT COMMUNITY TYPES IN RELATION TO INUNDATION REGIMES.....	118
3.1 INTRODUCTION.....	118
3.2 METHODS	119
3.2.1 Quantifying benchmarks, condition classes and scoring ranges for floristic community condition	119
3.2.2 Quantifying benchmarks, condition classes and scoring ranges for tree stand condition	134
3.2.3 Testing condition class schemas –trends in the condition response variables of PCTs in response to inundation regimes	136
3.2.4 Data analysis	141
3.3 RESULTS.....	143
3.3.1 Testing of floristic community condition schemas	143

3.3.2 Testing of tree stand condition schemas	169
3.4 DISCUSSION	179
CHAPTER 4 BUILDING ECOLOGICAL REFERENCE MODELS FOR WATER-DEPENDENT VEGETATION	
COMMUNITIES IN INLAND FLOODPLAIN WETLANDS: MACQUARIE MARSHES CASE STUDY	193
4.1 INTRODUCTION.....	193
4.2 METHODS	194
4.2.1 Data collection and preparation	194
4.2.2 Assigning floristic community and tree stand condition scores to sites.....	195
4.2.3 Inundation predictor variables	196
4.3 ECOLOGICAL REFERENCE MODELS.....	196
4.3.1 Optimising time-scale for water regime of each plant community	196
4.3.2 Modelling relationship between condition score and predictor variables.....	199
4.4 RESULTS.....	200
4.4.1 River red gum forest, PCT 36	202
4.4.2 River red gum woodland, PCT 36A	205
4.4.3 Red gum grassy woodland, PCT 454	209
4.4.4 Flood-dependent woodland, PCT 40	211
4.4.5 Water couch marsh grassland, PCT 204.....	215
4.4.6 Mixed Marsh sedgeland, PCT 53.....	217
4.4.7 Lignum shrubland wetland, PCT 247	219

Abstract

Inland floodplain wetland plant communities of the Macquarie Marshes occur in the lower reaches of the Macquarie River catchment in the Murray-Darling Basin in semi-arid South-eastern Australia. The natural flood regimes are no longer operating in the Marshes due to river regulation, and in periods of low catchment rainfall they are now sustained solely by delivered environmental water allocations. Flood-dependent plant communities can show considerable negative ecological consequences when natural flow and flooding regimes are significantly disrupted. For effective management of water resources to meet targets for the maintenance and restoration of flood-dependent plant communities, it is critical to know the condition or state of the component plant communities, and to quantify change in condition in response to inundation actions.

This research developed quantitative condition benchmarks derived from a long-term dataset and adds to the knowledge of water requirements for eight inland wetland flood-dependent plant communities of the Macquarie Marshes. It examines the benchmarks and key inundation predictors for forests and woodlands dominated by river red gum (*Eucalyptus camaldulensis*), woodlands of coolibah (*E. coolabah*), shrublands of lignum (*Duma florulenta*), and non-woody wetland communities of water couch (*Paspalum distichum*), sedges (*Eleocharis* spp.) and floodplain grasslands. Condition class schemas for measuring community and tree stand condition were developed and tested using Multivariate Regression Forest (MRF) analysis of data collected at 74 sites in the Macquarie Marshes from 2008 to 2016. The most important inundation regime predictor variables for these vegetation communities were identified from companion inundation data using MRF. Then Ecological Reference Models (ERMs) were developed using Generalised Linear Mixed Modelling (GLMM), of condition scores against inundation regime predictor variables.

The study of the Macquarie Marshes explores the assessment of flood-dependent vegetation community condition using species group responses to water regime and a wetland vegetation typology that can be applied to other flood-dependent vegetation communities and other wetlands. Both the condition class schemas and the ERMs could assist in data supported decision making about current and future ecological restoration activities by defining the appropriate species composition and structure for these and similar flood-dependent vegetation communities.
