Advanced Control Strategies for Multilevel Power Converters in Hybrid Microgrid Applications

A thesis submitted for the degree of **Doctor of Philosophy** 

### Shakil Ahamed Khan

(2019)

#### Title of the thesis:

Advanced Control Strategies for Multilevel Power Converters in Hybrid Microgrid Applications

**Ph.D. student:** Shakil Ahamed Khan E-mail: Shakil.A.Khan@student.uts.edu.au

Supervisor: Professor Youguang Guo E-mail: Youguang.Guo-1@uts.edu.au

**Co-Supervisor:** Professor Jianguo Zhu E-mail: jianguo.zhu@sydney.edu.au

Address: School of Electrical and Data Engineering University of Technology Sydney, 81 Broadway, Ultimo, NSW 2007, Australia

## **Certificate of Original Authorship**

I, Shakil Ahamed Khan declare that this thesis, is submitted in fulfilment of the requirements for the award of Doctor of Philosophy, in the School of Electrical and Data Engineering at the University of Technology Sydney.

This thesis is wholly my own work unless otherwise reference or acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

This document has not been submitted for qualifications at any other academic institution.

This research is supported by the Australian Government Research Training Program.

Production Note: Signature removed prior to publication.

#### Shakil Ahamed Khan

Date: 11 February 2020

### Acknowledgments

I would like to express my sincere gratitude to my principal supervisor Professor Youguang Guo, for his guidance and sincere encouragement throughout my graduate studies. I am also grateful to Professor Jianguo Zhu, my co-supervisor, for his mentorship and support in my research. Their opinions and advice have provided me with great assistance in completing my Ph.D. research work.

I would also like to express thanks to my research group mates, in particular Dr. Yam Siwakoti of the Centre for Electrical Machines and Power Electronics, University of Technology Sydney (UTS), for their precious time, mentorship, sharing of knowledge and technical support.

I would also like to express my gratitude to all my friends for their encouragement. I especially would like to thank Mahmudul Hasan Sohag and Sabbir Ahamed Khan for their constant support and encouragement.

My deepest and most gratitude goes to my family members, my father Md Ismail Khan, my mother Mst Shefali Akther. Finally, I would like to thank my loving Sanzida Tafseer Nishat for her endless love, support and continued patience.

### Abstract

In recent years, the traditional electrical power grids are gradually changing into smart grids and emerging as the next-generation power systems. The application of power electronics is playing a vital role in these changes. The recent advancements in power electronics have provided significant momentum for high penetration of renewable energy sources, energy storages, and modern loads into the hybrid microgrid associated with the smart grid. Nevertheless, it also introduces several challenges in terms of reliability and robustness, power quality, and cost. Developing advanced control strategies and converter architecture to mitigate these challenges will be vital. This thesis presents advanced control strategies and circuit architectures for the grid-connected system in hybrid-microgrid applications. The system parameter variations and uncertain disturbances are critical for achieving the control objectives in AC/DC power conversion. In this thesis, disturbance rejection based control strategies have been proposed and implemented to ensure improved steady-state and dynamic performances to follow the references. The control of power converters connected with the electrical grid requires fast and accurate estimation of grid voltage parameters (i.e., amplitude, phase, and frequency), which are carried out using the grid synchronization method. The performance of synchronization methods is affected by the growing power quality issues. This thesis presents novel methods for fast and accurate estimation of the grid voltage parameters. These methods demonstrate enhanced performance to eliminate the disturbances, such as the presence of DC-offset, harmonically distorted grid, grid frequency variations, voltage sag and swell, etc. This thesis also presents a novel singlesource three-phase multilevel converter with voltage boosting capability for medium-voltage photovoltaic applications. The new circuit structure significantly reduces the DC-link voltage requirements, the number of components and their voltage stresses in comparison to traditional topologies. It can reduce the dc-link voltage requirements by 75% in comparison to the traditional neutral point clamped (NPC), flying capacitors, active NPC (ANPC), hybrid and hybrid clamped ANPC topologies, and 50% to advanced ANPC topologies. It can also reduce the number of required switches and capacitors as well as their voltage stresses compared to these state-of-the-art topologies reported in the literature so far. The performance

of the proposed control techniques and circuit topologies have been validated by simulation and experimental results. **Keywords:** Advanced Control; Hybrid Microgrid; Model Predictive Control; Multilevel Converter; Observer Design; Sliding Mode Control.

## Nomenclature

#### Global abbreviations used in this thesis

AC	=	Alternating Current
ANPC	=	Active Neutral Point Clamped
APF	=	Active Power Filters
AHB	=	Asymmetrical H-Bridge
ANF	=	Adaptive Notch Filter
AFE	=	Active Front End
BW	=	Bandwidth
CMBMC	=	Common Magnetic-Bus Multilevel Converter
CHB		Cascaded-H-bridge
DC	=	Direct Current
DES	=	Distributed Energy Source
DG	=	Distributed Generation
DSP	=	Digital Signal Processor
DPC	=	Direct Power Control
EV	=	Electric Vehicle
ES	=	Energy Storage
ESS	=	Energy Storage Systems
ESO	=	Extended State Observer
EMI	=	Electromagnetic Interference
EMC	=	Electromagnetic Compatibility
FCS	=	Finite Control Set
FIR	=	Finite Impulse Response
FLL	=	Frequency-Locked Loop
FLC	=	Fourier Linear Combiner
FC	=	Flying Capacitor
G2V		Grid-to-Vehicle
IIR	=	Infinite Impulse Response
IPT	=	Inverse Park Transformation
LPF	=	Low Pass Filter
LMS	=	Least Mean Square
MLI	=	Multilevel Inverter
MC	=	Multilevel Converter
MPC	=	Model Predictive Control
MMC	=	Modular Multilevel Converters
MAF	=	Moving Average Filter
MMPD	=	Modified Mixer Phase Detector
MWFLC	=	Modified Weighted-Frequency Fourier Linear Combiner
NPC	=	Neutral Point Clamped
NF	=	Notch Filter
PI	=	Proportional Integral

PR	=	Proportional Resonant
PV	=	photovoltaic
PCC	=	Point of Common Coupling
PLL	=	Phase-Locked Loop
PD	=	Phase Detector
PWM	=	Pulse Width Modulation
QSG	=	Quadrature Signal Generation
RES	=	Renewable Energy Source
RECS		Renewable Energy Conversion System
SMC	=	Sliding Mode Controller
SVR	=	Step Voltage Regulator
STATCOM	=	Static Synchronous Compensator
SOGI	=	Second-Order Generalized Integrator
SRF	=	Synchronous Reference Frame
THD	=	Total Harmonic Distortion
TD	=	Transfer Delay
UPS		Uninterruptible Power Supplies
VSC	=	Voltage Source Converter
V2G	=	Vehicle-to-Grid
VOC	=	Voltage Oriented Control
VCO	=	Voltage-Controlled Oscillator
WES	=	Wind Energy System
WFLC	=	Weighted-Frequency Fourier Linear Combiner
