2021

Doctor of Philosophy
Graduate School of Health, Discipline of Pharmacy:
University of Technology Sydney

CERTIFICATE OF ORIGINAL AUTHORSHIP

I Elyssa Katlin Wiecek declare that this thesis, is submitted in fulfilment of the requirements for the award of Doctor of Philosophy, in the Graduate School of Health at the University of Technology Sydney.

This thesis is wholly my own work unless otherwise referenced or acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

This document has not been submitted for qualifications at any other academic institution.

This research is supported by a University of Technology Sydney International Research Scholarship and a University of Technology Sydney President's Scholarship.

This research is supported by the Australian Government Research Training Program.

Abstract

Background

Non-adherence to medications remains a global crisis with high prevalence causing worsening health outcomes, increased morbidity, and even death. Multiple dimensions affect the medication-taking process ranging from patient-related determinants to health system causes. Many interventions to improve adherence have seen disappointingly modest improvements with the most effective strategies including multiple components. These interventions are normally delivered as a package without the full understanding of what are the most effective components. The Digital Revolution has put mHealth (mobile health) at the forefront of new, emerging tools for improved adherence. An approximate 200 new mHealth apps are added to the market each day with 46% of patients adapting mobile technology to improve their health in the previous twelve months. While the technical tools within apps such as dosage reminders have been proven effective, other components such as rewards and gamification have yet to be evaluated. The variety of components being offered also warrants an exploration of the opinions of their users. Through understanding effectiveness by adherence outcomes and users' experiences within these mHealth offerings, a full understanding of their success and acceptability is possible.

Objectives

To explore, analyse and estimate the effect of interventions to improve medication adherence. This research aimed to gain a better understanding of the combination of components within effective interventions as well as evaluated an emerging mHealth tool, Perx Health. Simultaneously, beliefs, perceptions and experiences of users of the innovative mHealth intervention were explored to understand the acceptability and adoption of the technology.

Methodology

A series of discrete studies were undertaken: (1) a network meta-analysis of studies assessing the effectiveness of interventions and their components aimed at improving medication adherence; (2) evaluation of the impact of an innovative mHealth intervention, Perx, utilising multiple components on sustaining optimal adherence levels; and (3) analysis of users' beliefs, perceptions and experiences within the mHealth app for an understanding of the app's desirability and adoption as a tool to improve adherence.

Results

The network meta-analysis identified 249 studies evaluating interventions to improve adherence over multiple periods of time. Multicomponent interventions were found to be the most effective interventions at improving adherence over 10 months, with education in combination with technical and attitudinal components (OR 0.49, 95% CrI 0.27-0.88) and rewards in combination with technical interventions having the most effective odds ratio (OR 0.03, 95% CrI 0.01-0.13) against standard of care. The Perx mHealth app utilising rewards, technical components, education and attitudinal components revealed high rates of adherence, average at 87.6% (SD 16.9%), above an optimal adherence threshold standard of 80%, over 6 months. An analysis of 6,296 user reviews of the mHealth app discovered a highly accepted and appreciated tool for aiding the management of medication adherence. Users reacted positively to reminder and reward components specifically, though expected improvements within technical functionality issues and the frequency of rewards.

Conclusion

Interventions to improve medication adherence have revealed modest improvements in effectiveness, with a continued need for multicomponent interventions to sustain adherence over 10 months. The evaluated mHealth intervention, Perx, utilising multiple components, including rewards, technical, education and attitudinal components, highlighted an intervention able to sustain optimal adherence rates over time. User reviews recognised a highly desirable and appreciated mHealth intervention in aiding the management of medication adherence. MHealth interventions should continue to

be innovated and adopted as helpful tools in improving medication adherence but must be evidence-based and evaluated for their effect on health outcomes.

Acknowledgements

This research is supported by a University of Technology Sydney International Research Scholarship and a University of Technology Sydney President's Scholarship.

Thank you to my supervisors, Professor Charlie (Shalom) Benrimoj; Emeritus Professor, University of Sydney, Dr Victoria Garcia-Cardenas; Senior Lecturer, Graduate School of Health, School of Pharmacy, UTS, Professor Kylie Williams; Head of Discipline, Pharmacy, Graduate School of Health, School of Pharmacy, UTS., and Dr Rachelle Cutler; Lecturer, Graduate School of Health, School of Pharmacy, UTS.

In addition to my supervisors, I would like to acknowledge and thank the wonderful colleagues, co-authors, and external companies, both at UTS and abroad, with whom I have collaborated. Their guidance and knowledge lead to develop research I was excited and passionate about and I learned so much from you all in the process.

I would like to thank the staff and academics at the Graduate School of Health for their support and encouragement throughout my experience at UTS. The supportive community gave me opportunities and motivation I am forever grateful for.

To the fellow PhD students on this journey with me, I would not have survived this without our support system. To Carmen, who shared every step of this experience with me from the beginning until the end. Your company kept me sane, and every hug provided the love and family I needed on the other side of the world. To Andrea, for being my excel master and data expert. This research and my perseverance throughout this thesis would not have been possible without you.

Lastly to my friends, family, and partner, thank you so much for your unconditional love and support. You all believed in me throughout my highs and lows and even when I

barely believed in myself. To my partner, thank you for taking care of me when I needed it the most and for being my number one fan. To my parents, sister, brother-in-law, uncle, and grandmother, I am eternally grateful for your comfort, cheerleading, and emotional support and would not be where I am today without you.

Preface

This thesis is presented in fulfilment of the doctoral degree (Doctor of Philosophy) requirements of the University of Technology Sydney, Australia.

The thesis is structured as a PhD by compilation. Chapter 1 contains a research overview and an outline of the overall rationale, objectives and organisation of the thesis. Chapter 2 provides the background and reasoning for the research. Chapters 3-5 comprise the results including a network meta-analysis assessing comparative effectiveness of interventions to improve medication adherence, evaluation of a mobile health app's impact on medication adherence and an exploration of user beliefs, perceptions and experiences using the aforementioned mobile health app. The chapters have been structured as research articles containing all corresponding references, figures, tables and appendices related to the research activity. This is followed by Chapter 6, which discusses the results, summarises the contribution of work and provides recommendations for future research.

Elyssa K Wiecek is the primary author of each publication. Additionally, co-authors contributed to the conception or design of the work, data collection, data analysis and interpretation, or revision of the manuscripts.
