

# **The Development and Testing of a Forensic Interpretation Framework for use on Anthropometric and Morphological Data Collected During Stance and Gait**

A thesis submitted in fulfilment of the requirements for the degree of  
Doctor of Philosophy

*By*

**Dilan Seckiner**

Bachelor of Medical Science (Human Bioscience - Anatomy) WSU

Bachelor of Forensic Biology in Biomedical Science UTS

Bachelor of Forensic Science (Honours) in Biomedical Science UTS

Centre for Forensic Science

School of Mathematical and Physical Sciences

University of Technology Sydney

July 2021

## Certificate of Original Authorship

I, Dilan Seckiner declare that this thesis, is submitted in fulfilment of the requirements for the award of Doctor of Philosophy, in the Centre for Forensic Science/Mathematical and Physical Sciences at the University of Technology Sydney.

This thesis is wholly my own work unless otherwise referenced or acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

This document has not been submitted for qualifications at any other academic institution.

This research is supported by the Australian Government Research Training Program.

## Acknowledgements

I would like to collectively thank my four wonderful supervisors Dr Philip Maynard, Dr Xanthé Mallett, Prof Claude Roux and Prof Didier Meuwly and express my profound gratitude. Words cannot express the level of appreciation I feel for your aspiring guidance, direction, encouragement, and constant support that kept me on track. I am so fortunate to have a supervisor dream team, whom I learnt so much from and always look up to. Thank you for being my greatest champions.

I would like to thank Dr Simone Gittelson, Prof Richard Wright, Natasha Benson and Ana Popovic for your statistical guidance, coding, mentoring, kindness and patience. I am so grateful for your guidance and support.

Thank you to Russell Trennery and Sep Mirto both who sourced a room for me to film my participants. I am so grateful that you worked so hard to find me a room to film in and store my equipment. Thank you to UTS security, especially Bob Hueston and Daniel Cesar for providing me with CCTV footage and for suggesting areas to record my research. I am exceedingly fortunate for such a supportive unit.

I am forever indebted to my participants, who kindly gave up their time to partake in my research. Thank you so much, this research would not be possible without you all.

Thank you to my mother and father, Selma Seckiner, and Ahmet Seckiner, for your unconditional love. Thank you for always supporting me and for encouraging me to reach for the stars. It's because of you that I believe I can achieve anything I set out to do, overcoming any obstacle along the way.

A special thank you to Craig Leeming, for being my second pair of eyes with formatting, for being there for me during my ups and downs and for keeping me focused. Thank you for your love, for making me laugh during stressful times and for being my pillar of strength. Thank you for your constant enthusiasm and for fuelling my passion for research.

Thank you to Theresa Sutherland for your invaluable feedback, unwavering support, motivation and love. Thank you for listening to me with equal excitement when I went on and on about my research, for picking me up during times of stress and for all the coffee dates.

## Thesis by Compilation Declaration

The following publications will be included in the thesis titled ‘The Development and Testing of a Forensic Interpretation Framework for use on Anthropometric and Morphological Data Collected During Stance and Gait’ in the form of a thesis by compilation. PhD candidate Dilan Seckiner researched, wrote and edited the publications, while Dr Philip Maynard, Dr Xanthé Mallett, Prof Claude Roux and Prof Didier Meuwly all contributed their feedback, provided valuable guidance and their edits to the articles. Both of the following publications were accepted and published in Forensic Science International and will be included in chapter 1 of this thesis.

### Forensic Image Analysis - CCTV Distortion and Artefacts (Accepted)

Dilan Seckiner<sup>1</sup>, Xanthé Mallett<sup>2</sup>, Claude Roux<sup>1</sup>, Didier Meuwly<sup>3</sup> and Philip Maynard<sup>1</sup>

3. Forensic Gait Analysis: Morphometric Body Assessment and Image Quantification. *21<sup>st</sup> Triennial Meeting of the International Association of Forensic Sciences Conference, Toronto Canada, 2017*
4. Forensic Gait Analysis: Morphometric Body Assessment and Image Quantification. *Australian and New Zealand Forensic Science Society International Symposium 24<sup>th</sup> International Symposium located in located in Auckland, New Zealand, 2016*
5. Forensic Body Mapping: Morphometric Gait Analysis and the Quantification of associated CCTV Distortion’. *New Horizon Conference Presentation located at Royal North Shore Hospital, Sydney, Australia, 2014*

# Contents

1. CHAPTER 1: Introduction.....	1
1.1 Forensic Image Analysis - CCTV Distortion and Artefacts .....	2
1.1.1 Abstract.....	2
1.1.2 Introduction.....	2
1.1.2.1 The Age of Surveillance Technology .....	4
1.1.3. The Ultimate Goal: To Determine the Limitations Presented by Distortion and Artefacts .....	6
1.1.3.1 Artefact and Distortion Analysis.....	7
1.1.3.1.1 Extrinsic Artefact and Distortion Analysis .....	8
1.1.3.1.2 Intrinsic Artefact and Distortion Analysis .....	12
1.1.4 Artefacts and Distortion within Australian and International Courts of Law .....	17
1.1.5 Conclusion .....	18
1.2 Forensic Gait Analysis - Morphometric Assessment from Surveillance Footage .....	20
1.2.1 Abstract.....	20
1.2.2 Introduction.....	20
1.2.2.1 The Gait Cycle .....	21
1.2.2.2 Development of Gait Assessment .....	22
1.2.2.3 Impacts upon Gait .....	23
1.2.3 Forensic Use.....	26
1.2.3.1 Forensic Gait Examination: Human Based.....	27
1.2.3.1.1 Photo Comparison.....	27
1.2.3.2 Gait Recognition: Computer Based – Human Assisted .....	30
1.2.4. Uses of Gait Analysis.....	33
1.2.4.1 The Legal System.....	35
1.2.5 Conclusion .....	38
1.3 The Proposed Research.....	43
1.3.1 Objectives .....	41
1.3.2 Research Questions.....	42
2. CHAPTER 2: Standardised Photography, Manual, Demographic and Repeatability Studies.....	47

2.1 Introduction.....	47
2.2 Aims.....	47
2.3 Materials and Methods.....	48
2.3.1 Ethics Approval .....	48
2.3.2 Camera Standardisation and Method Development.....	48
2.3.2.1 Camera Settings, Offset and Geometric Studies .....	54
2.3.2.2 Electronic Equipment, Hardware, and Software.....	58
2.3.2.3 Camera to Subject Distance .....	60
2.3.2.4 Lighting and Camera Height.....	60
2.3.2.5 High Shutter Speed Photography .....	60
2.3.2.6 Limitations .....	66
2.3.3 Database and Subject Selection Criteria .....	66
2.3.3.1 Footage.....	66
2.3.4 Templates and Plumb Line for Stance Assessment .....	67
2.3.4.1 Development of a Plumb Line for Motion Assessment and Refinement of Plumb Line for Motion Assessment.....	68
2.3.5 The ‘ Camera Skew’ Issue .....	73
2.3.6 Repeatability Studies.....	75
2.3.7 Assessment of Variables .....	76
2.3.7.1 Anthropometric Measurements.....	76
2.3.7.2 Morphological Features .....	87
2.3.8 Data Processing of Images and Footage .....	90
2.3.9 The User Manual.....	92
2.3.9.1 Manual for Stance and Gait .....	93
26 Lateral weight bearing of the feet .....	94
2.3.10 Data Collection Procedure .....	95
2.3.10.1 Anthropometry .....	95
2.3.10.2 Morphology.....	95
2.3.11 Statistics for Error Analyses: Anthropometry and Morphology .....	95
2.3.11.1 Repeatability Studies.....	96

2.4 Results.....	97
2.4.1 Final Camera Settings .....	97
2.4.2 Demographic.....	98
2.4.2.1 Stance Demographic .....	99
2.4.2.2 Gait Demographic.....	101
2.4.3 Repeatability Assessment .....	103
2.4.3.1 Plumb Line Repeatability Assessment.....	103
2.4.3.2 Morphology Repeatability Assessment.....	104
2.4.3.2 Anthropometry Repeatability Assessment.....	107
2.4.4 Additional Features Not Included within the Data Sheet.....	112
2.5 Discussion.....	113
2.5.1 Photographic Conditions.....	113
2.5.1.1 Motion Blurring .....	113
2.5.2 Development of a Protocol for Morphometric Analysis.....	113
2.5.3 Demographic.....	114
2.5.4 Importance of Standardisation and Repeatability Studies.....	115
2.6 Conclusions.....	116
3. CHAPTER 3: Distinctiveness of Features .....	117
3.1 Introduction.....	117
3.2 Aims.....	117
3.3 Materials and Methods.....	118
3.3.1 Analysis of Primary Database.....	118
3.3.1.1 Exclusion of Features.....	118
3.3.1.2 Exclusion of Participants .....	118
3.3.1.3 Limitations of Assessment.....	119
3.3.2 Statistical Methods for Analyses.....	120
3.3.2.1 Principle Component Analysis.....	121
3.3.2.2 Hierarchical Cluster Analysis .....	121
3.3.2.3 Correspondence Analysis.....	122

3.3.2.4 Linear Discriminant Analysis .....	124
3.4 Results.....	125
3.4.1 Heat Maps .....	125
3.4.2 Frequency Values within the Given Population.....	128
3.4.3 Stance Anthropometry .....	132
3.4.3.1 Raw Data for Stance Anthropometry Analyses .....	132
3.4.3.2 Normalised Data for Stance Anthropometry Analyses .....	135
3.4.3.3 Sex Data Treatment on Normalised Data for Stance Anthropometry Analyses .....	144
3.4.3.4 Linear Discriminant Analysis for Stance Anthropometry Analyses .....	153
3.4.3.5 Ancestry Data Treatment on Normalised Data for Stance Anthropometry Analyses....	158
3.4.3.6 Age Data Treatment on Normalised Data for Stance Anthropometry Analyses .....	162
3.4.4 Gait Anthropometry .....	166
3.4.4.1 Combined Gait Anthropometry .....	166
3.4.4.2 Static Gait Anthropometry .....	181
3.4.4.3 Dynamic Gait Anthropometry .....	183
3.4.5 Stance Morphology .....	183
3.4.5.1 Raw Data Stance Morphology – R Studio .....	183
3.4.5.2 Normalised Data Stance Morphology –R Studio.....	183
3.4.5.3 Correspondence Analysis for Stance Morphology .....	187
3.4.5.4 Linear Discriminant Analysis for Stance Morphology .....	188
3.4.6 Gait Morphology.....	197
3.4.6.1 Raw Data Gait Morphology – R Studio.....	197
3.4.6.2 Normalised Data Gait Morphology –R Studio.....	197
3.4.6.3 Linear Discriminant Analysis for Gait Morphology .....	200
3.5 Discussion.....	209
3.5.1 Screening of the Data and Frequency Values .....	209
3.5.2 Stance Anthropometry and Morphology.....	210
3.5.2.1 Sex.....	211
3.5.2.2 Ancestry .....	211

3.5.2.3 Age.....	212
3.5.3 Gait Anthropometry and Morphology .....	213
3.5.3.1 Sex.....	214
3.5.3.2 Ancestry .....	214
3.5.3.3 Age.....	215
3.6 Conclusion .....	216
4. CHAPTER 4: Case Studies: Development and Application of Bayesian Statistics to Gait Analysis	
217	
4.1 Introduction.....	217
4.1.1 Bayesian Frameworks: Likelihood Ratio.....	217
4.2 Aim .....	218
4.3 Methods and Materials.....	219
4.3.1 CCTV Camera and Filming Location.....	219
4.3.2 Analysis of Surveillance Footage.....	224
4.3.3 Evaluation of Strength of Evidence .....	224
4.3.3.1 Calculation of Likelihood Ratio for Morphology .....	225
4.3.3.3 Calculation of Likelihood Ratio for Anthropometry (Model One).....	228
4.3.3.4 Calculation of Likelihood Ratio for Anthropometry (Model Two) .....	228
4.4 Results.....	232
4.4.1 Morphology Assessment of Case study .....	232
4.4.1.1 Stance.....	232
4.4.1.2 Gait.....	232
4.4.2 Anthropometry Assessment of Case study .....	233
4.4.2.1 Stance Model One.....	233
4.4.2.2 Gait.....	234
4.4.3 Distribution graphs to View Dependant and Independent Features.....	235
4.4.3.1 The Distribution Graphs.....	236
4.4.3.2 Family of Features .....	242
4.4.5 Anthropometry Model Two .....	260

4.4.5.1 Principle Component Analysis: Model Two for Stance.....	260
4.4.5.2 Variances between Photoshop and GIMP.....	264
4.4.5.3 Likelihood Ratio for Stance Anthropometry.....	265
4.4.5.3.1 Hd True Tests.....	266
4.4.5.3.2 Hp True Tests.....	268
4.5 Discussion.....	272
4.5.1 Likelihood Ratios: Morphology and Anthropometry (Model One).....	272
4.5.2 Likelihood Ratios: Anthropometry (Model Two) and Hd/Hp True Tests .....	274
4.6 Conclusion .....	275
5. CHAPTER 5: Case Studies: Assessment of Isolated Influences .....	276
5.1 Introduction.....	276
5.2 Aims.....	276
5.3 Methods and Materials.....	277
5.3.1 Room and Equipment.....	277
5.3.2 Treadmill Speed and Load Carriage Preference .....	281
5.3.4 Limitations .....	283
5.4 Results.....	285
5.4.1 Observational Analyses.....	285
5.4.1.1 Normal .....	285
5.4.1.2 Backpack.....	287
5.4.1.3 Hoodie.....	289
5.4.1.4 Side bag.....	291
5.4.1.5 Thongs.....	293
5.4.1.6 Barefoot.....	295
5.4.1.7 Run.....	297
5.4.1.8 Treadmill.....	299
5.4.1.9 Incline .....	301
5.4.2 Linear Discriminant Analysis .....	303
5.4.2.1 Load Carriage.....	303

5.4.2.2 Attire .....	305
5.4.2.3 Footwear .....	306
5.4.2.4 Speed.....	308
5.4.2.5 Treadmill.....	309
5.5 Discussion.....	311
5.5.1 Observational Analysis .....	311
5.5.2 Linear Discriminant Analysis .....	312
5.5 Conclusions.....	313
6. CHAPTER 6: Conclusions and Future Directions.....	314
6.1 Summary and Conclusions.....	314
6.2 Future Directions .....	316
6.2.1 Future Directions for Morphometric Technique, Repeatability and Reproducibility .....	316
6.2.2 Future Directions for Influences that Impact Gait .....	318
6.2.3 Future Directions for Likelihood Ratio.....	319
6.2.4 Future Directions for Forensic Investigation and Forensic Intelligence .....	319
APPENDIX.....	321

## List of Figures

Figure 1.1 The Differing Types of Measurements/Proportions Analysed for Gait. The anthropometric measurements of the body (static and dynamic features) are applied for the assessment of gait. Static features (a) are defined as the geometrical measurements of the body, i.e. individual’s length of whole leg, length of individual’s knee to foot height etc. Examples of measurements taken are represented by lines. Dynamic features (b) are measurements related to gait. For instance, the distance between the left and the right toe during gait, distance between knees, stride length etc. The examples of such measurements are represented by the lines. ....	28
Figure 1.2 The Morphology of the Lower Limbs. Morphology consists of the qualitative (feature by feature) analysis of size, shape and form of human anatomy. The images indicate the differing orientation of the legs representing bow legs (a) and (b), straight (c) and knock kneed (d) and (e).....	28
Figure 1.3 The Superimposition of the Mock ‘POI’ and ‘Suspect’. Superimposition is defined as the overlay of images. As indicated in the above figure, the suspect (d) was superimposed on top of the POI (in pink) to determine similarities and differences. This technique is applied as more of a visual aid to determine similarities and differences. (a) is an image of the POI. Within (b) and (c), the suspect is gradually superimposed onto the suspect, and (d) is an image of the suspect. ....	29
Figure 2.1 Photographic Room Measurements. The figure provides a representation of the position of the cameras and the distance of the relationship between objects. The starting points 1, 2 and 3 were created as a result of the limitation of successfully capturing the full gait cycle of a taller subject, therefore the staggered starting points (0.3m distance between each point) aim to obtain the full gait cycle. This figure is not to scale.....	50
Figure 2.2 Retractable Rods within Backdrop Set up. The retractable rods required more than two individuals to set up to secure them in place. Even when secured the rods were observed to collapse, thus leading to the backdrop dropping. Once a larger room was sourced, the retractable rods were redundant.....	51
Figure 2.3 Final Photographic and Room Measurements. This figure shows the measurements of the area designated for filming within the store room. This figure is not to scale.....	52
Figure 2.4 An Example of the Photographic Studio Set Up. Although multiple rooms were utilised, the premise of the photographic set-up remains the same: A) Navy Backdrop 1; B) Navy Backdrop 2; C) Navy Backdrop 3; D) Position of Retractable Rod 1 concealed by the by the backdrop; E) Position of Retractable Rod 2 concealed by the backdrop; F) Position of Retractable Rod 3 concealed by the backdrop; G) A marker to indicate the furthest point the subject walked till and the starting point of the gait cycle; H) Marker on ground to indicate the closest distance to the camera the subject walked to and the position that the stance images were photographed; I) A marker on the ground to indicate the furthest left the subject was instructed to walk till; J) A marker on the ground to indicate the furthest right a subject walked until; K) The Camera; L) The tripod.....	53

Figure 2.5 Distortion Sheet. The distortion sheet assessed distortion caused by intrinsic (within camera) or extrinsic factors (the subject/environment). An image distortions sheet was created to detect the presence of such distortions. The red lines indicate the measurements that were taken, whilst Table 2.1 details the order the measurements were taken in..... 55

Figure 2.6 Camera Distances. The red brackets indicate the measurements that were taken for assessing distance between the offset distortion sheets (1.93m), camera distance to the offset distortion sheets (3.21m) and the distance between the offset distortion sheets with the direct distortion sheet (2.84m). The blue lines indicate the pathways that were walked by the subject (A – B for profile views, whilst C – D for Anterior/posterior views). The distortion sheet was measured at 5.4, as the subject started turning their bodies (to turn around and walk the other way) beyond this point. The subjects were asked to walk to the whole distance of C-D, followed by A-B..... 57

Figure 2.7 High Shutter Speed Photography Trial. (a) Represents a still cut from a video recording during PhD candidature, (b) Displays a photo as a result from high shutter speed photography, whereas (c) indicates a still cut from a video recording from Seckiner (2014) ..... 61

Figure 2.8 High Shutter Speed Photography Frames in Profile View. The following frames (a) – (e) displayed within this figure presents all frames captured. Absence of multiple phases of gait has eliminated this as an option to obtain data. .... 62

Figure 2.9 High Shutter Speed Photography Frames in Anterior View. The following frames (a) – (e) displayed within this figure presents all frames captured. Absence of multiple phases of gait has eliminated this as an option to obtain data. .... 63

Figure 2.10 High Shutter Speed Photography Trial with Canon 70D in Anterior View. Images show each frame that was captured in anterior view..... 64

Figure 2.11 High Shutter Speed Photography Trial with Canon 70D in Profile View. Images show each frame that was captured in profile view..... 65

Figure 2.12 Plumb Line Alignment During Stance. The application of a plumb line allows further morphological variables to be assessed, an example being the shoulder placement of a subject and whether it falls anteriorly, posteriorly or on the centre of the plumb line..... 67

Figure 2.13 The Original Alignment of the Plumb Line for Gait Developed in Seckiner (2014) (as adapted from YouTube, 2011). Two purple lines run through the (a) medial and lateral malleolus for the lateral view and (b) through both lateral malleolus for each foot. The centre of these two lines are then measured and the yellow line in both (a) and (b) is the reference (plumb) line. (a) applies to both left and right profiles whilst (b) applies to both anterior and posterior..... 69

Figure 2.14 Plumb Line for Gait Revisited (as adapted from YouTube, 2011; Herr and Popovic, 2008). (a) The lower body line is the Ground Reaction Force (GRE), whereas the upper body runs through the inner ear to the centre of the body to determine the displacement of the upper limbs. (b) The malleolus (outermost points of ankles) were selected in Seckiner (2014) for the anterior image, as the lower limbs

are responsible for advancement of the body and weight bearing, whereas arm movements result from lower limb movement. ....	70
Figure 2.15 Plumb Line Measurement for Gait Revised (as adapted from YouTube, 2011). The final and revised plumb line determination for error testing as seen by the (a) Upper and (b) Lower body. The measurements include: [1] Upper body plumb height, [2] From midpoint to posterior of body, [3] From midpoint to anterior of body, [4] Height. The lower body (b) was error tested for anthropometric purposes rather than plumb line to determine trailing and leading limbs. ....	71
Figure 2.16 Plumb Line Measurement for Gait Plumb Line Repeatability Studies(as adapted from YouTube, 2011). Measurements: [1] Upper body plumb, [2] Lower body plumb, [3] From midpoint to posterior of body, [4] From midpoint to anterior of body, [5] From heel of trailing limb to midline of lower body plumb, [6] From toe of leading limb to lower body plumb, [7] Height. ....	72
Figure 2.17 Image Captured with Skew. The original image capture on camera. ....	74
Figure 2.18 Image Alterations to Accommodate Skew. The yellow line indicates the original plumb line whereas the green line shows the altered plumb line. The pink line is showing the level of skew. ....	75
Figure 2.19 Static Measurements (as adapted from YouTube, 2011). The variables that were measured are detailed within Table 4.9 below. ....	77
Figure 2.20 Refined Static Measurements (as adapted from YouTube, 2011). The variables that were measured are detailed within Table 4.9 below. ....	78
Figure 2.21 Dynamic Measurements (as adapted from YouTube, 2011). The variables that were measured are detailed within Table 4.10 below. ....	79
Figure 2.22 Dynamic Measurements Revised (as adapted from YouTube, 2011). The variables that were measured are detailed within Table 4.11 below. ....	80
Figure 2.23 Angle Measurements (as adapted from YouTube, 2011). The variables that were measured are detailed within Table 4.12 below. ....	81
Figure 2.24 Anthropometric Measurements Taken from all Views. Further detail is provided within the Morphometric Manual (Supplementary 1). ....	84
Figure 2.25 The “Anatomical” Position Compared to the “Normal” Position. This figure shows an example of the subject in both anatomical [(a) and (c)] and comfortable [(b) and (d)] stance positions. ....	86
Figure 2.26 Standardised Image Template for Stance. ....	92
Figure 2.27 Sample of the Atlas. The Figure provides an example of one variable produced within this research project (Supplementary 1). ....	94
Figure 2.28 Demographic for Stance. Pie graphs for sex, age and ancestry for stance indicate the percentage of each group relative to one another. ....	99
Figure 2.29 Full Demographic for Stance. Further pie graphs were generated for stance to look at all three age, sex and ancestry groups combined, showing that the largest groups were ‘Female Caucasian 1’ and ‘Male Caucasian 1’. ....	100

Figure 2.30 Demographic for Gait. Pie graphs for sex, age and ancestry for gait indicate the percentage of each group relative to one another.....	101
Figure 2.31 Full Demographic for Gait. Further pie graphs were generated for gait to look at all three age, sex and ancestry groups combined, showing that the largest groups were ‘Female Caucasian 1’ and ‘Male Caucasian 3’ . .....	102
Figure 2.32 Plumb Line Error Study Results for Gait. The assessment of TEM% indicated the plumb line heights and the heights of the subjects fell well under the threshold, which is suitable for stance. The remaining variables however exceeded the 1.5 value deemed acceptable by ISAK (Perini et al., 2005). .....	103
Figure 2.33 Repeatability Studies for Gait Using Cohen’s Kappa Statistics. Cohen’s Kappa results show that all variables show a true agreement above the 0.5 value, aside from ‘backward arm swing: rotation of left hand’, ‘forward arm swing: level of elbow flexion of left arm’, ‘midstance: placement of right foot’ and ‘swing: lateral placement of lower right leg. ....	105
Figure 2.34 Repeatability Studies for Stance Using Cohen’s Kappa Statistics. Cohen’s Kappa results show that all variables show a true agreement above the 0.5 value, aside from ‘antero-posterior placement of right hand’ .....	106
Figure 2.35 Stance Anthropometry Error Study Results. The assessment of TEM% indicated that all variables fell well under the threshold, thus displaying that the operator displayed minimal error.....	108
Figure 2.36 Static Anthropometry Error Study Results. The assessment of TEM% indicated that all variables aside from ‘right foot width’ fell well under the threshold, thus displaying that the operator displayed minimal error. ....	109

Figure 3.3 Graphical Representation of Principal Component Analysis. Principle Component Analysis was conducted to statistically view the interrelationship of the stance anthropometric profiles of subjects (indicated by blue dots). Dispersion of the subjects indicate that no two individuals had the same	

profile. Subjects 003MD and 024MD (red circle) specify similar anthropometric profiles as observed by the closeness of the two points, whereas subjects 034FD and 007FD are seen to be separate from one another (green circles)..... 122

Figure 3.4 Graphical Representation of Correspondence Analysis. Correspondence Analysis was conducted to statistically view the interrelationship between morphological profiles of subjects during gait. Dispersion of the subjects (blue dots) indicate that no two individuals contain the same profile. Subjects 003MD and 024MD (red circles) were seen within Figure 3.3 as grouped, however when compared to their morphology, they were observed to be segregated to one another in this graph. Likewise, with the green circle containing subjects 034FD and 007FD shows their morphological profiles are clustered within this figure, indicating similarity between morphological profiles, but difference in anthropometric profiles..... 123

## Abstract

The ubiquitous nature of surveillance cameras allows continuous monitoring of an area where footage can be obtained for later use, if criminal or other activity of interest occurs, for investigative and evaluative purposes. In the process, gait is often important as facial analysis is not always possible due to obstruction of the face. Subsequently, a photo-comparative analysis of the footage and of a Person of Interest (POI) may be required. Such examination involves evaluation of the strength of evidence at both activity and source level, thus underlining its importance.

The aim of this PhD research is to assess and improve the scientific approaches applicable to forensic gait analysis through the investigation and development of an interpretation framework. The specific objectives include the development of an analytical model for morphometric body and gait analysis that shows distinctive features of gait in a forensic context, whilst determining features of the body during stance and gait (walk and run). The method includes a morphometric assessment of 25 anthropometric measurements (static and dynamic), 35 morphological features for stance and 51 morphological features for gait (male/female volunteers). Furthermore, the frequency, distinguishability and dependency of features within subpopulations were observed whilst viewing correlations of age/ethnicity/sex and examining the robustness of gait to different conditions (accessories, and environment) in forensic scenarios (speed and attire [hoodie] performing the best).

As a result, a standardised protocol was produced, and population databases established from which frequency statistics were attained. Moreover, features were observed as either common or distinct (most distinct observed as in-toeing of the feet and lateral placement of the hand) once compared to all age (85.39% predictive accuracy), ancestry (94.57% predictive accuracy) and sex (98.5% predictive accuracy) categories for correlation assessment. These components were then applied to assess the strength of evidence between the trace and the reference materials, resulting in a likelihood ratio score.

As a forensic tool, the forensic gait analysis method often lacks validation and its evaluation misses empirical substantiation. Nevertheless, the availability of trace material in numerous cases and the potential for development of the method suggests that research in this topic cannot be overlooked. The broader purpose of this study established a method of evaluating gait analysis

that offers valuable information to the criminal justice system whilst being scientifically robust and highlighting its limitations.
