

Performance and Mechanism of Autogenous Self-healing in Cementitious Composites Materials

by Caihong Xue

Thesis submitted in fulfilment of the requirements for
the degree of

DOCTOR OF PHILOSOPHY

under the supervision of

Principal Supervisor: Professor Vute Sirivivatnanon

Co-Supervisor: Professor Jianchun Li

Co-Supervisor: Dr Marie Joshua Tapas

External Supervisor: Professor Kejin Wang

External Supervisor: Professor Caijun Shi

University of Technology Sydney

Faculty of Engineering and Information Technology

Sep 2021

CERTIFICATE OF ORIGINAL AUTHORSHIP

I, *Caihong Xue*, declare that this thesis, is submitted in fulfilment of the requirements for the award of Doctor of Philosophy, in the School of Civil and Environmental Engineering, Faculty of Engineering and Information Technology at the University of Technology Sydney.

This thesis is wholly my own work unless otherwise referenced or acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

This document has not been submitted for qualifications at any other academic institution.

This research is supported by the Australian Government Research Training Program.

Signature: Production Note:
Signature removed prior to publication.

Date: Sep 20, 2021

Acknowledgements

Completing the Ph.D journey is never a solitary effort, and as always, I am extremely grateful to many people and feeling really lucky to have them in my life. On the top of the list are my supervisors, Professor Vute Sirivivatnanon, Professor Jianchun Li, Dr Marie Joshua Tapas, Professor Kejin Wang and Professor Caijun Shi. More than anything, they supported me when I felt the most helpless, and that gave me the confidence to begin again, to follow my dreams and to be myself. I keep telling myself, if possible in the future, I want to be a supervisor like them to deliver all the kindness and help that I received from them to others, always considering the needs of students, spending time on student's work, giving the student freedom to do research in their own way and providing technical guidance for further improvement. Moreover, thanks for their guidance, comments and patience on my dissertation. Without out them, I will never get there.

I would also like to thank Professor Hadi Khabbaz for helping me go through the most difficult time.

I am also extremely thankful to Professor Arnaud Castel for the handwritten comments on my work, which inspired me to work hard on research. Likewise, I am thankful to Dr Paul Thomas for his detailed comments and explanation on test methods and results, allowing me to learn faster and efficiently.

I would like to thank UTS Mortar and Concrete lab, UTS Science, UTS Environmental Lab and UTS workshop for providing the facilities and equipment. I would also like to thank Mr Rami Haddad, Muller Hailu, Herbert Yuan, Mohammed. Johir, Scott. Graham and Miss Ann Yan for providing professional technical assistant.

I would like to thank my friends from UTS for making my PhD life colourful and memorable. Thanks for accompanying me to finish the Sydney Marathon and enjoy the beauty of Australia.

I would like to thank my life friend in China for the trust and encouragement. Thanks for always being there for me.

I am extremely grateful to my mother, for her unconditional love and support. Finally, the little girl is no longer a student.

Lastly, I would like to thank China Scholarship Council (CSC) and UTS for providing financial support for my study.

<i>m_i</i>	Mass change in grams
<i>t</i>	Self-healing duration

w_i	Width of a crack before self-healing
w_t	Width of the crack after self-healing

Roman symbols (uppercase)

A_i	Area of crack mouth before self-healing
A_t	Area of crack mouth after self-healing
$E_{original}$	Elastic modulus of the original specimen
$E_{cracked}$	Elastic modulus of the cracked specimen
ERI	Compressive elastic modulus recovery index
I	Slope of the best fit line for water absorption
$IDaRUPV$	Stiffness/damage recovery measured by UPV
ISR	Index of flexural strength recovery
$ISR_{pre-peak}$	ISR for pre-peak cracked specimens
$ISR_{post-peak}$	ISR for post-peak cracked specimens
COD	Crack Opening Displacement
$K_{cracked}$	Gas permeability coefficient of the cracked specimen
$K_{self-healed}$	Gas permeability coefficient of the self-healed specimen
$K_{flexural_self-healed}$	Slope of $P_{flexural}-COD$ for the self-healed specimen
$K_{flexural_cracked}$	Slope of $P_{flexural}-COD$ for the cracked specimen
$K_{flexural_original}$	Slope of $P_{flexural}-COD$ for the original specimen

$K_{split_self-healed}$	Slope of P_{split} - COD for the self-healed specimen
$K_{split_cracked}$	Slope of P_{split} - COD for the cracked specimen
$K_{split_original}$	Slope of P_{split} - COD for the original specimen
P_{split}	Splitting tensile load
$P_{split_unloading}$	Unloading splitting tensile load
$P_{split_max_principal}$	Principle peak splitting tensile load of the original specimen
$P_{split_max_secondary}$	Secondary peak splitting tensile load of the original specimen
$P_{split_max_self-healed}$	Maximum splitting tensile load of the self-healed specimen
$P_{split_cracking_original}$	Splitting tensile cracking load of the original specimen
$P_{split_cracking_self-healed}$	Splitting tensile cracking load of the self-healed specimen
$PRI_{splitting}$	Splitting tensile load capacity recovery
$P_{self-healed}$	Water permeability of the self-healed specimen
$P_{cracked}$	Water permeability of the cracked specimen
$P_{flexural_max_original}$	Maximum flexural load of the original specimen
$P_{flexural_unloading}$	Unloading flexural load
$P_{flexural_max_cracked}$	Maximum flexural load of the cracked specimen
PDI	Plastic damage index
PRI	Plastic damage recovery index
$PRI_{flexural}$	Recovery of the flexural load capacity

R_p	Relative water permeability
S_i	Initial water sorptivity
$S_{i,wet/dry,self-healed}$	Initial sorptivity of the self-healed specimen
$S_{i,wet/dry,original}$	Initial sorptivity of the original specimen
S_s	Secondary water sorptivity
$S_{s,wet/dry,uncracked}$	Secondary sorptivity of the self-healed specimen
$S_{s,wet/dry,original}$	Secondary sorptivity of the original specimen
SDI	Stiffness damage index
$SDI_{cracked}$	Stiffness damage index of the cracked specimen
$SDI_{self-healed}$	Stiffness damage index of the self-healed specimen
$SDI_{original}$	Stiffness damage index of the original specimen
$SDI_{strength}$	Compressive strength reduction index
$SRI_{c_stiffness}$	Compressive stiffness reduction recovery index
$SRI_{c_strength}$	Compressive strength recovery index
$SRI_{flexural,stiffness}$	Flexural stiffness recovery index
$SRI_{splitting,stiffness}$	Splitting tensile stiffness recovery
$UPV_{self-healed}$	Ultrasonic pulse velocity of the self-healed specimen
$UPV_{cracked}$	Ultrasonic pulse velocity of the cracked specimen
UPV_{virgin}	Ultrasonic pulse velocity of the virgin specimen

Creek symbols

σ_c	Compressive stress
σ_N	Nominal flexural stress
σ_{N_loss}	Nominal flexural strength loss due to cracking
$\sigma_{N_Inherent}$	Inherent nominal flexural strength regain
$\sigma_{N_unloading_virgin}$	Unloading nominal flexural strength of virgin specimen
$\sigma_{N_unloading_cracking}$	Unloading nominal flexural strength during cracking
η_{gas}	Recovery of the gas permeability of the cracked specimen

Abstract

The mechanical properties and durability of concrete structures can be seriously impaired by cracks. The need to reduce the risk of cracking and repair the damage caused by concrete cracks led to the development of self-healing cementitious composite materials (SHCCMs). SHCCMs are able to heal cracks without human intervention and can generally be classified into either autogenous self-healing or autonomous self-healing. In comparison with autonomous self-healing, autogenous self-healing is more cost effective and easier to implement in full-scale application, while it is limited to healing crack widths of about 100-150 μm .

Supplementary cementitious materials (SCMs), expansive minerals and crystalline admixtures (CAs) are used to promote the autogenous self-healing of cementitious composite materials and develop SHCCMs. However, the absence of standardized test procedure and performance assessment criteria for self-healing resulted in disagreement with regard to the effectiveness of stimulated autogenous self-healing in concrete. The benefit of SHCCMs to durability of cracked concrete in chloride solutions and marine environments is not well understood. Moreover, in order to tailor self-healing reactions of SHCCMs for better performance, it is necessary to understand the mechanisms of stimulated autogenous self-healing. Currently, these issues are hindering the application and development of SHCCMs.

In this study, the methodology for evaluating the influence of autogenous self-healing on the mechanical properties and durability performance of concrete was developed and validated. Cracked specimens with and without CAs were exposed to water, sodium chloride solutions and seawater to facilitate self-healing. Afterwards, the effect of self-

healing on the compressive, flexural and splitting tensile properties, water absorptivity as well as chloride penetration of cracked materials was assessed. The mineralogy of self-healing products was also characterized to reveal the mechanism of autogenous self-healing. Furthermore, the influence of CAs on the hydration and leaching behaviour of cement was investigated, in order to explore factors that can help improve the autogenous self-healing of cementitious composite materials.

With regards to mechanical properties, autogenous self-healing improves the stiffness but barely affects the load capacity of cracked specimens under compressive, flexural and splitting tensile loading. Indexes that are related to stiffness are recommended for self-healing performance assessment. The results also highlight that exposure environments affect self-healing mechanisms (reaction) and subsequently, self-healing performance. The rate of crack closure is fastest in seawater followed by NaCl solutions and water, which results in the lower chloride penetration into self-healed cracked specimens from seawater than NaCl solution. The rapid precipitation of $Mg(OH)_2$ in cracks dominates the self-healing in seawater. Compared to water, NaCl solutions accelerate self-healing by promoting the precipitation of $CaCO_3$ in cracks. This suggests that a faster rate of self-healing helps improve the durability of cracked structures more than the type of products that form during self-healing. Moreover, the hydration and leaching behaviour of cement incorporating CAs indicates that a higher pH of the pore solution and a reasonable degree of carbonation could benefit the self-healing of cementitious composite materials.
