Faculty of Science

CERTIFICATE OF ORIGINAL AUTHORSHIP

I, Md Hafizur Rahman declare that this thesis, is submitted in fulfilment of the requirements for the award of Doctor of Philosophy, in the School of Life Sciences, Faculty of Science at the University of Technology Sydney.

This thesis is wholly my own work unless otherwise referenced or acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

This document has not been submitted for qualifications at any other academic institution.

This research is supported by the Australian Government Research Training Program.

Date: 21 March 2022

Acknowledgements

At the end of this most challenging part of my life, I would like to express my gratitude to all the great people who have supported me along the way. First and foremost, I would like to acknowledge my supervisor Associate Professor Maurizio Labbate. A massive thank you for accepting me to explore the beautiful world of bacterial evolution and adaptation. I simply could not have achieved this academic fulfilment without your guidance, encouragement and support. Despite having a busy schedule and responsibilities, you never failed to ensure the well-being of your students. Your passion and enthusiasm for science has been inspirational. It has been a great privilege to learn from you and to work with you.

I would also like to express my sincere gratitude to Associate Professor Diane McDougald for accepting me as one of her students and providing me with great ideas, advice and support in the lab. A huge thanks to my other co-supervisor, Dr. Khandaker Rayhan Mahbub, for his continuous help in the lab, teaching me everything he knew and for his friendship. I am very grateful to the School of Life Sciences of the University of Technology Sydney for providing me with the opportunity to work with its wonderful and helpful team. Also, I would like to acknowledge my mother organization, Bangladesh Livestock Research Institute (BLRI) for allowing me to pursue this study through a paid education leave.

I sincerely appreciate all past and present members of Maurizio's and Diane's labs, particularly Dr. Gustavo Espinoza Vergara, Dr. William L. King, Khue Viet Nguyen, Angus Ritchie and Md Mozammel Hoque who have made this journey an amazing and productive one. Thank you very much for your kindness and help.

I don't have any words that fully demonstrate my love to my beloved parents for making me capable beyond my imagination. I thank them for everything they have taught me and for all the support and love given. A very warm and special thank you to my dear wife, Shaima Anjuman, and to my beautiful son, Abrar H Rahman for making my life cheerful with love and support. They are both my strength and happiness.

Last but not least, to Allah, the Most Gracious and the Most Merciful, who makes everything possible and who gives meaning to my life.

Abstract

Vibrio cholerae is a marine aquatic bacterium and the causal agent of the devastating diarrhoeal cholera disease that sickens millions of people each year. Persistence in the environment of this pathogen is an important area of research as this is where it resides in between periodical disease outbreaks. In the environment, *V. cholerae* deals with numerous stresses including temperature fluctuations, lack of nutrients, salinity and bacteriophage. Additionally, predatory action by free-living heterotrophic protists called protozoa is a major problem for *V. cholerae* growth and survival in the environment. Several mechanisms are employed by *V. cholerae* in environmental persistence, of which biofilm formation is considered a key mechanism. *V. cholerae* preferably forms biofilm on chitin, a long chain polymer present in the exoskeletons of crustaceans in the aquatic environment which apart from being a nutritive source, induces natural competency that allows free uptake of DNA through a mechanism of lateral gene transfer (LGT) called transformation. LGT is when DNA is transferred between bacterial cells and is considered an important evolutionary mechanism in *V. cholerae* through acquisition of novel genetic traits usually on mobile genetic elements such as genomic islands, phage or transposons. Chromosome 2 of *V. cholerae* carries one such mobile genetic element called the integron that facilitates the insertion of mobile genes called gene cassettes and contains more than 150 gene cassettes of which 80-90 % are of unknown or uncharacterised function. Integration, deletion or rearrangement of gene cassettes is dependent on a recombinase called the integron-integrase (encoded by *intI*A) that recognises *attC* sites associated with gene cassettes and facilitates their insertion within the *attI* site of the integron and to a lesser extent, *attC* sites of gene cassettes in the cassette array. *intI*A is induced by the SOS response a regulatory cascade requiring RecA that is activated by the presence of single-stranded DNA (ssDNA) due to stalled DNA replication from damage (e.g. fluoroquinolones, β lactams, UV exposure) or from acquisition of ssDNA from LGT processes.

In order to study chitin induced transformation and *intI*A transcription in *V. cholerae*, this thesis described the construction of circular and linear gene cassettes and investigated their transfer into the *V. cholerae* chromosomal integron of chitin-competent cells and demonstrating that the integron is a novel site for adding DNA for complementation of mutations in *V. cholerae*. Additionally, insertion of the artificial gene cassettes into *attI* and two different *attC* sites were shown to affect bacterial surface properties and biofilm formation most likely due to enhanced transcription of downstream gene cassettes due to the presence of internal promoters in the

artificial gene cassettes. Finally, one of the artificial gene cassettes was used to investigate cassette transfer dynamics in *V. cholerae* in the presence of two bacteriovorist protozoa, the ciliate *Tetrahymena pyriformis* and the amoeba *Acanthamoeba castellanii*. This thesis shows that following internalization and packaging of *V. cholerae* into the food vacuoles (also called phagosomes) of both protozoa, intracellular ROS induces the SOS response leading to enhanced integron-integrase expression and gene cassette recombination (up to 405-fold more cassette integration). ROS production is a key feature of killing within the phagosome causing DNA damage leading to mutagenesis that results in stalling of DNA replication and generating an excess of single ssDNA. In addition, this thesis shows that due to the indiscriminate feeding behaviour of protozoa, co-localisation of different species such as *V. cholerae* and *E. coli* in the same phagosome can facilitate LGT. It is shown that *V. cholerae* utilizes its T6SS to kill and release artificial gene cassette DNA from *E. coli* to make it accessible for uptake and subsequent integron-integrase mediated integration.

Taken together, this thesis, through the creation of artificial gene cassettes to study integron integration dynamics, highlights the importance of integron-associated gene cassettes in biofilm formation and shows the importance of protozoa in driving LGT-driven adaptation and evolution in *V. cholerae*.

3.1 Introduction	68
3.2 Methods and materials	69

3.2.1 Bacterial strains and growth conditions.....	69
3.2.2 Construction of <i>V. cholerae</i> deletion mutants	69
3.2.3 Complementation of <i>V. cholerae</i> gene cassette deletion mutants and gene cassette overexpression in the wild-type.....	74
3.2.4 Gene cassettes bioinformatics	74
3.2.5 Colony morphology and growth curve assays.....	75
3.2.6 Crystal-violet biofilm assay.....	75
3.2.7 Congo red binding assays	75
3.2.8 Conversion of <i>V. cholerae</i> to rugose morphology.....	76
3.2.9 Statistical analysis.....	76
3.3 Results	77
3.3.1 Insertion of the artificial pKC01 gene cassette and gene cassette deletions alter biofilm formation in <i>V. cholerae</i>	77
3.3.2 Insertion of the artificial pKC01 gene cassette and gene cassette deletion in <i>V. cholerae</i> alters binding of the polysaccharide stain Congo red.....	80
3.3.3 Insertion of artificial pKC01 gene cassette and gene cassette deletion in <i>V. cholerae</i> does not alter colony morphology	83
3.3.4 Bioinformatic analysis of deleted gene cassettes	84
3.4 Discussion	85
3.5 Supplementary information.....	88
Chapter 4 Integron-integrase-mediated lateral gene transfer in <i>V. cholerae</i> is enhanced in the presence of bacteriovorist protozoa.....	89
4.1 Introduction	89
4.2 Method and materials	91
4.2.1 Bacterial strains and growth conditions, plasmids and oligonucleotides	91
4.2.2 Growth and maintenance of protozoa.....	95
4.2.3 Construction of <i>V. cholerae</i> strains	95
4.2.4 Co-incubation experiments with protozoa.....	96
4.2.5 Confocal laser scanning (CLSM) microscopy.....	97
4.2.6 GFP fluorescence quantification	98
4.2.7 Reactive oxygen species (ROS) quantification and quenching experiments	98
4.2.8 Quantitative reverse transcriptase PCR (qRT-PCR)	99
4.2.9 Statistical analysis.....	99
4.3 Results	100
4.3.1 The <i>V. cholerae</i> integron-integrase is expressed inside protozoal food vacuoles .	100

4.3.2 Enhanced gene cassette transfer and integration in <i>V. cholerae</i> occurs within the food vacuoles of protozoa.....	105
4.3.3 The <i>V. cholerae</i> T6SS is required for integron-integrase mediated HGT between bacterial cells inside protozoa.....	105
4.3.4 The SOS response is required for <i>intIA</i> expression in <i>V. cholerae</i> within the food vacuoles of protozoa.....	109
4.3.5 ROS is involved in SOS response induction of <i>intIA</i> and HGT in <i>V. cholerae</i> within the food vacuoles of protozoa.....	109
4.4 Discussion	111
4.5 Supplementary information.....	114
Chapter 5 : General discussion and future work.....	115
5.1 Short thesis summary	115
5.2 Are gene cassettes important in driving surface property variation in <i>V. cholerae</i> ? ...	116
5.3 Are protozoal food vacuoles an important site for bacterial evolution?	118
5.4 Summary of future directions.....	121
