

RF Self-Powered Sensor to Design Fully Autonomous IoT Devices

by Majid Amiri

Thesis submitted in fulfilment of the requirements for
the degree of

Doctor of Philosophy

under the supervision of A/Prof. Mehran Abolhasan, A/Prof.
Justin Lipman and Dr. Negin Shariati Moghadam

University of Technology Sydney
Faculty of Engineering and Information Technology

February 2022

STATEMENT OF ORIGINALITY

I, Majid Amiri declare that this thesis, is submitted in fulfilment of the requirements for the award of the degree of doctor of philosophy, in the faculty of Engineering and Information Technology at the University of Technology Sydney. This thesis is wholly my own work unless otherwise referenced or acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

This document has not been submitted for qualifications at any other academic institution.

This research is supported by the Australian Government Research Training Program.

ABSTRACT

The need for continuous, accurate and autonomous sensors has increased significantly given the rapid growth of the Internet of Things (IoT). Sensors collect data for a specific measurable phenomenon. Data may then be transmitted to a controller or cloud service for processing. Alternatively, data may be (pre)processed on the sensor device prior to transmission. Sensors are a necessary element of IoT devices. Sensors are designed to detect specific phenomenon and convert this into digital data that can be leveraged for analytics and machine learning to determine future actions.

The energy consumed by a sensor has a direct impact upon the IoT device and its application and requirements. Depending upon the phenomenon being sensed, supporting continuous operation may be critical as discontinuities in sensing may result in the sensing of a phenomenon missing vital data points thereby limiting accuracy. Further continuous sensing increases the overall energy consumption of the IoT device, reducing overall lifetime of operation of the IoT device or the need for frequent battery replacements. Self-powered sensors provide a promising solution to produce autonomous sensors that can operate both indefinitely and free from energy source limitations. Self-powered sensors can acquire energy using varying types of ambient energy.

Recently, various ambient energy sources have been used to implement self-powered sensors. However, these structures require specific requirement to provide electricity. Alternatively, ambient electromagnetic (EM) waves in the environment can be used as a new power source due to the ubiquitous wide spread modern use of wireless communication. However, the available energy levels of ambient EM signals is low. Therefore, to harness EM signals, a highly efficient receiver is required. The use of a rectenna is a common solution to convert EM signals to electricity, however there is still need for EM energy harvesting to be significantly improved. Metamaterials are a promising solution to address this problem. Literature has shown metamaterial perfect absorbers (MPAs) are promising candidate for both sensing and EM energy harvesting. This thesis explores potential uses of MPAs for highly efficient EM harvesting and passive sensing of phenomenon.

ACKNOWLEDGEMENTS

This thesis would not have been fulfilled without the supervision and guidance of many individuals who contributed and extended their valuable assistance in the preparation and completion of this study.

First, I would like to express my profound gratitude to my supervisor A/Professor. Mehran Abolhasan for his continuous guidance and support throughout my PhD study with his patience and knowledge. A/Professor. Mehran Abolhasan has provided me with an excellent research environment. I am greatly inspired by his deep insights into technical issues.

My sincere thanks goes to my co-supervisors Dr. Negin Shaiati and A/Professor. Justin Lipman, for their unconditional support and valuable guidance during this thesis. It is an honour for me to work with them during my studies. They were always available and willing to assist. They have not been only a great advisors, but also an encouraging and motivating friends.

Being a member of RFCT Lab at University of Technology Sydney (UTS) was an excellent experience for me. Many of the ideas in our work emerged from discussions and teamwork. My sincere thanks goes to all the students and staff of RFCT Lab for their help in the whole process leading to conceptualization of the project.

I like to thank all my friends (too many to list here but you know who you are!) for providing support and friendship that I needed all these years as well as happy distractions to rest my mind outside of my research.

In the end, I would like to express my forever thanks to my parents for their unconditional love, unreserved support and encouragement through my life.

5.26	Sensitivity of filled MPA sensor with distilled water facing (a) Different polarization angles (TE), (b) Different polarization angles (TM), (c) Different incident angles (TE), (d) Different incident angles (TM).	144
5.27	Sensor's absorption characteristics for various permittivities.	144
5.28	Fabricated structure (a) Half channel structures, (b) Resonator and metal film, (c) Assembled sensor with empty channels, (d) Assembled sensor with filled channels.	145
5.29	Experiment setup to measure sensor's characteristics	146
5.30	Measured absorption characteristics of MPA sensor (a) Facing different polarization angles, (b) Facing different incident angles, (c) Different level of water salinity levels.	147
6.1	(a) The final unit cell structure, (b) The top view, (c) The bottom view.	151
6.2	The effect of adding lumped capacitor to the structure	152
6.3	The unit cell's equivalent circuit	152
6.4	Effect of different parameters: (a) The width of the metal path (w_t), (b) The width of the metal patch (w_p), (c) The gap between resonators (g), (d) The distance between resonator and substrate's cuts (d_c), (e) The air-gap height (h_a), and (e) lumped resistors' load (R).	154
6.5	The power flow diagram for: (a) unit cell, (b) 2×2 channeled structures, (c) 3×3 channeled structures, and (d) 4×4 channeled structures.	156
6.6	Absorption characteristics for (a) Changing polarization angle, (b) Changing incident angle.	156
6.7	Absorption characteristics for changing soil moisture level in and loamy (a) Sand, (b) Loamy.	158
6.8	The schematic of EM-DC system.	159
6.9	Effect of load resistor on DC output (a) 5% moisture rectifier at, (b) 25% moisture rectifier. MHz	160
6.10	Efficiencies of two rectifiers at lower and higher soil moisture levels	161
6.11	Fabricated structure	162

6.12	Measurement setup to measure the absorption characteristics	162
6.13	Measured absorption characteristic facing, (a) Different polarization angles, (b) Different incident angles	164
6.14	Measurement setup to test sensing capability	165

LIST OF TABLES

2.1	Effectiveness of methods to enhance metamaterial absorber for different aims . . .	32
2.2	Some reported MPAs for removing undesired signals applications	35
2.3	Some reported MPAs for energy harvesting applications	46
2.4	Some reported MPAs for sensing applications	48
2.5	Different possible structures for one target application	49
2.6	Industrial applications of MPAs	50
3.1	The optimum values of unit cell.	59
3.2	Comparison of proposed absorber performance with other insensitive absorber in literature	62
3.3	Final values of parameters	70
3.4	characteristics comparison	70
3.5	Final values of structural parameters	77
4.1	Comparing the proposed and reported structure	88
4.2	The optimum values of unit cell.	95
4.3	Comparison of the performance of the proposed structure with literature.	101
4.4	Coefficient factor for different number of cells in each channel.	103
4.5	Performance comparison of the proposed structure with literature.	103
4.6	The minimum required power to run rectifier circuits.	104
4.7	Power at different sections of structure	109
4.8	Performance comparison of reported Metamaterial-based energy harvester	109
5.1	The optimum values of unit cell dimension.	118
5.2	The characteristics of various types of soil with different levels of moisture. . . .	125
5.3	Comparing different types of soil moisture sensor based on various methods	128

5.4	Some reported MPAs for removing undesired signals applications	129
5.5	Final dimensions of unit cell.	135
5.6	Final dimensions of channel	141
5.7	Comparing Reported structures for liquid sensing	145
5.8	The relation between salinity level and absorption frequency shifted	147
6.1	Effect of number of cell in each channel on absorption and harvesting efficiencies	156
6.2	Coefficient factor for different number of cells in each channel.	157
6.3	The characteristics of various types of soil with different levels of moisture. . . .	158
6.4	The minimum required power to run rectifier circuits.	160
6.5	Comparing different types of soil moisture sensor based on various methods . . .	163
6.6	The optimum values of rectifiers' components.	164
6.7	Power at different sections of structure	165

LIST OF ABBREVIATIONS

ABC	Acrylonitrile Butadiene Styrene
AC	Alternating Current
ADS	Advanced Design System
BW	Bandwidth
CP	Circularly-Polarization
CPW	Coplanar Waveguide
DC	Direct Current
DNG	Double Negative Material
EIRP	Effective Isotropic Radiated Power
EM	Electromagnetic
EMC	Electromagnetic Cage
ERR	Electric Ring Resonator
ESA	Electrically Small Antenna
FSS	Frequency-Selective Surfaces
IoT	Internet of Things
ITU	International Telecommunications Union
MPA	Metamaterial Perfect Absorber
PCB	Printed Circuit Board
PCR	Polarization Conversion Ratio
RF	Radio Frequency
SIW	Substrate-Integrate-Waveguide
SRR	Split-Ring Resonator
TE	Transverse-Electric
TENG	Triboelectric Nanogenerator
TM	Transverse-Magnetic
UWB	Ultra-Wideband
VHF	Very High Frequency
1D	One-dimensional
2D	Two-dimensional
3D	Three-dimensional
5G	Fifth Generation
