## **Certificate of original authorship**

I, Tsholofelo Jacqueline Sethibe, declare that this thesis submitted in fulfilment of the requirements for the award of Doctor of Philosophy (Information Systems), in the School of Professional Practice and Leadership in the Faculty of Engineering and Information Technology at the University of Technology Sydney.

This thesis is entirely my own work unless otherwise referenced or acknowledged. In addition, I certify that all information sources and literature are indicated in the thesis.

This document has not been submitted for qualifications at any other academic institution.

This research is supported by the Australian Government Research Training Program.

Production Note:  
Signature removed prior to publication.

Date: 30<sup>th</sup> Nov 2021

## Acknowledgements

My utmost gratitude goes to God for affording me the opportunity, strength, and health to study. I am also highly appreciative of my cheerleading squad that spurred me on throughout my studies. My husband, Abraham; my daughter (Aone), son-in-law (Phenyo), and son (Letang) put up with a long-distance wife and mother for a long time. My mother (IFM), sisters and brothers, extended family, and friends, made sacrifices in support of my studies. I am indeed humbled by such love and unwavering belief in my potential.

I sincerely thank my supervisors Associate Professor Babak Abedin and Professor Olivera Marjanovic for their dedication and selflessness in guiding me through my PhD journey. The lessons they shared and guidance they gave, the high research standards they upheld and the professional approach to research supervision made my study time worthwhile in UTS. They were an inspirational team that used a practical approach to supervision. I am also indebted to SANE Australia for permitting me to use their organisation's data for my study, and the support they provided. I am thankful to the group of experts in academia and information systems industry who shared their expertise in interviews. This cooperation between academics and industry through all the stages of my research availed practical and non-obsolete data for the study.

My earnest thanks also go to the administrative support of the Schools I have been part of – the former Information, Systems & Modelling, and the current Professional Practice and Leadership teams; their competence in supporting research students is commendable. With gratitude, I also acknowledge fellow PhD students and other academics within these departments, whose formal and informal discussions, sharing of ideas, and feedback helped to refine my thoughts during my study. I also profoundly appreciate my good friends and colleagues, Fatuma Namisango and Diah Priharsari for being a part of this research journey – the friendship and laughter, the meals we had together, the shared challenges, the insights we got from discussing our research projects, have all contributed to the good memories of UTS I will forever cherish.

Finally, I am very thankful to the University of Botswana for my financial upkeep throughout my study period.

## **Abstract**

The utilisation of digital health communities (DHCs) generates support, advice, and information, which have the potential to empower users – patients or carers, who join a digital health community for support. Empowerment is important because it enhances one's self-directed ability to cope with challenges, make informed decisions and mobilise needed resources to help users to regain a sense of control in their lives. This research contributes to the information systems (IS) body of knowledge by proposing and theorising the concept of empowerment for decision-making in digital health communities.

Despite the potential, it is not clear how digital health communities foster the empowerment of carers. It is also not clear how systematic professional facilitation, which some digital health communities utilise to combat information overload and asymmetry, affects empowerment. To address this lack of understanding, this study aims to investigate what constitutes empowerment, what support exchanges are generated by the digital health community use to empower, and what role is played by facilitator support in the empowerment of users. It draws empirical insights from a less-explored digital health community of informal carers of people with mental illness, based in Australia. It engages a mixed-methods approach (exploratory sequential design) to collect and analyse data from IS experts in interviews, carry out a content analysis on 3000+ messages, and conduct a web-based survey of informal carers. The inquiry is done through the theoretical lens of the empowerment theory.

The key findings of this study are (a). social support and experiential expertise are good predictors of carer empowerment (b). empowerment in a digital health community has an affective dimension in addition to intrapersonal, interactional and behavioural dimensions (c). the type of facilitator presence (collaborative, commanding, motivating) contributes to the carers' ability to make health-related and other decisions (d). facilitator support has a moderating effect on social support and experiential expertise. The findings also provide foundations for further investigation into empowerment, in particular, how to foster it for improved decision-making in digital health communities and other contexts.

Some contributions the study makes include, 1. extending the traditional empowerment theory and its application in the context of the digital health community, enabling theorisation of dual effects. 2. contributing further to understanding empowerment for decision-making. This is because most studies mentioning empowerment in digital health communities are on treatment adherence or doctor-patient relationship (Table 2.2). 3. contributing methodological skill, where the study involved the use of three phases of investigating a sequential, mixed-methods design.
