CERTIFICATE

I certify that this thesis has not already been submitted for any degree and is not being submitted as part of candidature for any other degree.

I also certify that the thesis has been written by me and that any help that I have received in preparing the thesis, and all sources used, have been acknowledged in this thesis.

Peter Whynes
.....

ACKNOWLEDGEMENTS

This research, although an accumulation of approximately five years of toil on my part, would not have been possible without the assistance and encouragement of a large number of individuals, many of whom I met during the course of this study. I am grateful to have the luxury of thanking a number of these people and hope those unmentioned do not believe that their efforts were not fully appreciated nor that they will be forgotten.

First, I would like to express my sincere gratitude to Dr. Jacob Oluwoye, my principal supervisor, whose perseverance, encouragement and guidance were instrumental in the completion of the thesis. I would also like to thank Dr. Merv Fiedler, my co-supervisor, whose constructive criticism through the latter stages of the research proved invaluable.

I am deeply indebted to Frances Lovejoy for her generosity in time, advice, critique, witticism, patience and insights in extending my understanding of the intricacies and capability of the Statistical Package for Social Sciences (SPSS software).

I would like to thank Colleen Mitchell of the University of Wollongong (New South Wales) who provided insightful advice on the direction that my thesis should follow and subsequently provided critical feedback of my work. I am also grateful to Dr. Janet Hannah of the University of Nottingham (England) for her critical review of my work over the past year.

Over a six month period, over forty representatives of government and non-government organisations providing services to humanitarian entrants were confronted with a three hour questionnaire and yet all welcomed my interest and gave of their time. The issues emerging from the surveys proved invaluable in the eventual focus of the surveys for the humanitarian entrants. I am, therefore, grateful to each and every one of these informants.

The humanitarian entrants surveyed were interviewed by volunteer field workers who I met through word-of-mouth as communities within Sydney learned of my interest in their settlement adjustment patterns. The large majority of field workers were of the same ethnic background as the entrants surveyed, most of them had also arrived in Australia as humanitarian entrants and a number of these interviewers translated the English language questionnaire into Farsi, Arabic and Bosnian. As each interview usually took about three hours, the generosity of both the interviewer and the respondent were overwhelming.

There were approximately ten field staff interviewing the Iraqis and I would like to express my immense gratitude to Mary Hanoun-Khilla, assistant to the NSW Program for Refugees and Displaced People with the National Council of Churches. Mary not only translated the entire questionnaire into Arabic but she also organised the field workers to administer the survey to the Iraqis as well as interviewed over twenty entrants herself. As a result of Mary's efforts, the Iraqi contingent supplied the majority of survey results!

Sharif Amin, Chairperson of the Mahajerin Support Group, was kind enough to translate the questionnaire into Farsi and to organise a small number of Afghan field workers. The small size of the Afghan community made it difficult to generate the desired number of respondents but Sharif was determined and almost single-handedly interviewed all the Afghans.

There were a number of volunteers who helped in the translation of the questionnaire into Bosnian with special thanks extended to Tarik Abdulhak and Nadja Zjakic for assisting in the translation and the conduct of interviews and Alma Makalic, Vesna Fuljic, and Irena Husaric for their advice and interviews.

To the 172 humanitarian entrants themselves, many thanks for sharing your experiences and it is hoped that the conclusions, implications and recommendations presented may well reach the ears and pens of policy-makers.

I also extend my deepest thanks to my father and late mother for their unwavering love and support and for introducing me to a work ethic and discipline which seems to allow almost any mountain to be climbed. I am grateful that I can share the fruits of my labour with my dad but, naturally, regret that my mother could not join in the moment.

My final thanks are reserved for my wife, Marianne who has whole-heartedly supported my dream over the past five years despite the attendant absences from home and country. Marianne, not only encouraged me and believed in the objectives of this study, but she also provided assistance in all facets of the research. Her patience was inexhaustible, her input immeasurable and my love and gratitude unquestionable.

The Post-Arrival Adjustment Process of Recently Arrived Humanitarian Entrants: A Case Study of Bosnian, Iraqi and Afghan Refugees in Sydney, Australia

ABSTRACT

The purpose of this research is to examine the initial post-arrival process of recently arrived humanitarian entrants into Sydney, Australia from three non-traditional source countries, Bosnia, Iraq and Afghanistan. Resettlement was examined from social, economic and health perspectives, with the determinants influencing the settlement process being identified as a precursor to understanding the long-term adjustment process.

A literature review on settlement adjustment from a multidisciplinary approach confirmed the dearth of research on early refugee settlement experience in Australia and overseas for groups other than the Indochinese. Such research has tended to concentrate on one of the specific aspects of settlement rather than attempting a holistic approach to understanding adjustment patterns. Subsequently, 44 key informants, representing over 25 different organisations providing services (both government and non-government) to humanitarian entrants, were individually surveyed to gather information on their clients' needs, perceptions and problems.

Issues emerging from both the literature review and key informants' survey formed the basis of a survey of 172 recently arrived Bosnian, Iraqi and Afghan humanitarian entrants. Among the statistical tools used to analyse the entrants' surveys were Pearson's correlation coefficient, analysis of variance, Kendall's tau correlation, Spearman's rho correlation and Cronbach's alpha.

Results indicated that during the initial settlement stage, the former socio-economic background of the entrants has little impact on their economic, social or health adjustment. Instead, the conditions of departure, such as the loss of property, long-term incarceration, torture and trauma, were found to have a far reaching influence on the entrants' social and health experiences in their new country; however, despite the variety of traumatic pre-departure experiences, the resilience of the entrants reinforced their determination to participate in the workforce.

Although commonalities were found among the three groups in settlement outcomes, there were also distinct differences. The groups shared difficulties such as post-arrival

unemployment, lack of suitable accommodation and family reunion concerns. However, the Bosnians, for example, experienced the greatest degree of health-related problems, the Iraqis expressed the greatest interest in sponsoring family members and the Afghans were the most well-adjusted of the three groups. Detailed policy implications are also presented; these emphasise that humanitarian entrants may experience adjustment difficulties qualitatively different from those of traditional migrants and argue for improved support services.
