Birthing Business in the Bush: It’s Time to Listen

Sue Kildea

A thesis submitted in accordance with the requirements for admission to the Degree of doctor of Philosophy.

Centre for Family Health and Midwifery
University Technology Sydney

March 2005
CERTIFICATE OF AUTHORSHIP / ORIGINALITY

I certify that the work in this thesis has not previously been submitted for a degree nor has it been submitted as part of requirements for a degree except as fully acknowledged within the text.

I also verify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

Signature of the Candidate
ACKNOWLEDGEMENTS

Four years ago, my partner and I were sitting on the back deck looking out over our tropical garden during a magnificent wet season downpour. We had to decide if we would move 1500 kilometers from our home in Darwin, to Sydney, to undertake our PhDs. We had been planning an extended trip to Alaska, incorporating a visit to explore how it was the Inuit had managed to establish birthing services in very remote areas. However, the opportunity for PhD study in Sydney had arisen and the decision to make the move meant the trip would need to wait till the study was complete. Little did I realise that the next four years would be an amazing journey in its own right.

Coming to Sydney and working with Lesley Barclay, at the Centre for Family Health and Midwifery, meant tumbling into a different world. The first year was overwhelming as we mingled with ‘clever’ people who seemed to have amazing knowledge of both national and international midwifery. Pat Brodie, Nicky Leap, Sally Tracy and Caroline Homer have all been fantastic role models whose encouragement, advice and nurturing have been much appreciated. They have all become great friends. There were opportunities to write grant applications (something I found exciting at first), partake in tendered work and learn, learn, learn. There were many times when I thought I had made the biggest mistake of my life, and regretted not taking the Alaskan option. The fortnightly student meetings, where many attended, provided the opportunity to learn about different research methods, and witness the trials and tribulations of other students, as we watched each other progress through our individual journeys. My thanks go to Lesley, Virginia Schmied and Marg Cook who were the ‘supervisory team’, guiding the student meetings and opening my eyes to the world of research. Special thanks must also go to the other students who participated in the meetings and assisted my progress. However, it has been the supervision from Lesley Barclay that has made the most impact on my work. She has the ability to make you believe that yours is the most important work in the world, coupled with her ever-present optimism and a superhuman speed with which she returns work. Additionally, in my second and third years, she provided the opportunity for consultancy in Indonesia. Together with the wonderful Judith Donoghue I was guided and mentored, and I met the most wonderful people. My second supervisor, Pat Brodie has been a friend.
and mentor, who has provided strength, wisdom and encouragement and the important set of ‘fresh eyes’ when mine and Lesley’s were clouded and fatigued.

During my many trips to Maningrida there were many people who assisted and contributed to my research. Most importantly I would like to thank Molly Wardaguga who has been my mentor since I first worked in Maningrida. She agreed to be a co-researcher with me and guided the research, simultaneously teaching me about Aboriginal ‘ways of knowing’. Together we accomplished so much more than we would have in isolation. The other women who were closely involved in advising the research and who deserve individual thanks were Margaret Dawunmal, Mary Mason, Deborah Wurrkidj, Elizabeth Gandabuma, Phyllis Dundudja and Dora Daiguma. A special thanks goes to all the people who told their stories and shared valuable time and information with me. Many people in Maningrida deserve my thanks, I would especially like to thank Ian Munro, whose hospitality and wise words of advice were ever present. Who would have thought you would get such great coffee so far from Sydney. The staff at the Health Centre have always been supportive and encouraging, giving generously of their time. In particular Hellen Matthews, has supported this research from the beginning, and whose insight and experience was considerable. I also thank the midwives, doctors, Aboriginal Health Workers and remote areas nurses who gave great feedback and were always happy to comment on the research. The staff at the Women’s Centre were wonderfully supportive, allowing me to use the Centre as my base each time I visited. Additional support was received from the Health Board and Bawinanga Aboriginal Corporation, with David Bond on hand with sage words of advice and Angie always able to sort out the money side of things. Staff at the Maningrida School and Health Centre were also often assisting with the logistics of the project; my thanks go to Isabelle Walker and Gai Wright. A grant from the Commonwealth Governments Rural Health Support, Education and Training scheme partly funded this research.

Each time I passed through Darwin I stayed with Sarah, Michael, Clancy and Margie and I thank them for their warm hospitality and friendship. Many thanks also to many of the staff at the Northern Territory Department of Health and Aged Care who assisted with the project. In particular Sandy McElligot, Sharon Weymouth, Leonie Conn, Jenne Roberts, Kim Johnson, Jeanette Boland, Ann Sanoti, Louise Clarke, Christine Connors and
Rosemary Lee. Special thanks goes to Juanita Sherwood in Alice, who is also doing her PhD, and as an Indigenous Researcher, was a supportive friend who offered ethical advice when I needed it most.

There are many people who were involved in the participatory action research groups and I cannot thank them personally due to confidentiality issues. However, I would particularly like to thank the Women’s Health Educators who spent much time, energy and effort in supporting the research. Others friends who have been particularly helpful and supportive along the way include Libby Bowell, Ree Dunn, Chris Evans, Vivian and Christian Boosz and Sue Moore.

Thanks also to my family, who have always believed I would get there, with a big special thanks to my sister, Cate. She has been my graphic designer and taught me about websites and what looks good and works. She never failed to make a picture, diagram or presentation look impressive, not quite artist in residence but at times almost! Thank you Cate.

Lastly, I would like to thank my partner, who has travelled on this journey with me. She has been up when I was down, believed in me when I wanted to pull out, and contributed to my personal wellbeing more than any will ever know. Enormous thanks to you Sue Kruske.

postings from the Forum.

**Navigator**
Computer terminology describing software and websites that assist in guiding people through the information that is available on the Internet to targeted areas.

**Post / Posting**
A post / posting is an electronic message that is posted on a Forum in response to a thread.

**Reach**
Computer terminology referring to the number of people who are sharing the information available on the Internet.

**Remote Workforce Agency**
Agency responsible for recruiting and supporting doctors in remote communities in the Northern Territory.

**Richness**
Computer terminology referring to delivering quality information.

**Search engine**
A computer program that retrieves documents, files or data from a database or from a computer network (especially from the Internet), eg. Google™ and Yahoo®.

**Telecommunications**
The science and technology of communication at a distance by electronic transmission of impulses, as by telegraph, cable, telephone, radio, or television.

**The Centre**
The lower half of the Northern Territory of Australia including Tennant Creek and Alice Springs.

**Thread**
A thread refers to a set of posts on a Forum. It is composed of an initial post about a topic and all responses to it.

**Top End**
The upper half of the Northern Territory of Australia including Katherine and Darwin.

**Webmaster**
The term Webmaster refers to a person who is responsible for the design and maintenance of a website.
Terminology and Notes

Many of the definitions that appear in this thesis, particularly the information technology definitions, are derived from the Internet site: Dictionary.com (Dictionary.com, 2005). This site has been developed by the Lexico Publishing Group. It includes words from 11 different dictionaries, including Webster’s Revised Unabridged Dictionary and The Free On-line Dictionary of Computing.

Indigenous Australians

There are many different Indigenous groups in Australia. Terms such as Aboriginal peoples, Aboriginal and Torres Strait Islander peoples and Indigenous have all been used in the literature. In this thesis I have followed the recommendations from ‘Communicating Positively, A guide to appropriate Aboriginal terminology’ (NSW Health, 2004) and I have used the term Indigenous with a capital as a form of respect.

When speaking specifically about Aboriginal people from the Maningrida region and in the Northern Territory (NT) I have commonly used the term Aboriginal, though at times I have referred to smaller groups of Aboriginal people by their language group. When making international comparisons I have tended to use the term Indigenous and when quoting from other sources I have generally used the term that has been used in the source material. I have used the terms non-Indigenous and non-Aboriginal interchangeably, referring to all other non-Indigenous Australians. I have also used the term Balanda when referring to non-Aboriginal people in the Maningrida and NT area, as this is a term that is commonly used and understood by the residents of this region. Other terms that have been used to describe Aboriginal peoples from different regions include Yolngu, Tiwi, Koori, Ngaanyatjarra.

Title

The term ‘Birthing Business’, when used in this document, encompasses a broad definition of issues about birth that are important to Aboriginal women, their families and care providers. Similar to the Aboriginal holistic definition of health it includes more than just the ‘physical issues’ and it incorporates preconception through to the postnatal period.

‘It’s time to listen’ is a phrase that is meant to encapsulate the need to ‘listen’ to Aboriginal women, community members, drawing on the available evidence and the
experiences of Indigenous peoples in other lands, in an attempt to introduce remote area birthing services.

Birth
When the terms ‘birth’ and ‘birthing’ are used as a verb, instead of the recognised verb ‘to give birth’, this is to reflect the terminology that is used in many Indigenous and midwifery communities in Australia.

Spelling
There was a lack of consensus on the spelling of many of the names and places in this thesis, particularly between language groups. An example of this would be the skin name that is spelt Ngarrichan in the Burarra language and Ngarridjdjan in the Eastern Kuninku language (Handelsmann, 1996). When appropriate I use the spelling that is recognised for the language group that I was describing. Linguists Murray Garde and Rebecca Green confirmed most of the spelling, with additional assistance received from Katie Cooper for the Burarra language. Hellen Matthews from the Health Centre assisted with the spelling of names. I sincerely apologise if any mistakes have been made.

Australian / United Kingdom spelling has been used throughout this thesis.

Northern Territory Health Department
During the course of this research the NT Health Department had a change of name from Territory Health Service (THS) to the Department of Health and Community Services (DHCS). In this thesis for ease of recognition when referring to this department I have used the more current term, DHCS.

Notes
All field notes are my own thoughts, ideas and notations unless otherwise stated. Due to the large size of the document it has been printed using Portable Document Format. At times this has resulted in unusual spacing between some letters, either reducing the space with letters running into each other, or giving the appearance of a space that is larger than normal. Though unfortunate, readability has not been compromised.

ABSTRACT

The challenge of ameliorating or preventing the health problems of Indigenous Australians living in remote areas is compounded by the profound professional, cultural, social and personal isolation of the health professionals who work there. This isolation has direct effects on the recruitment and retention of health professionals to remote communities, and their ability to work effectively in this unfamiliar environment. The overarching goal of this research was to strengthen the capacity of these professionals to improve the quality of remote area maternity services in Australia and the experiences and outcomes for birthing women and their families. This was achieved by investigating a process of engagement with a wide range of stakeholders and utilising contemporary communication technology through the Internet. A case study approach was undertaken using participatory action research (PAR) with the elements of rapid assessment, response and evaluation methods (RARE). The research explored, described and analysed the development of resources aimed at decreasing isolation and increasing communication in the remote setting. Identifying the barriers, facilitators and utility of an information technology intervention was an integral part of the investigation process.

The first case study saw the development and evaluation of the Maternity Care in the Bush Web Based Resource Library, designed to decrease the isolation of practitioners from the educational resources and professional expertise available in current literature, guidelines and reports. The second case study targeted isolation from peers, with the development and evaluation of the Remote Links Online Community. This was designed to build partnerships between isolated practitioners, for the purpose of interactive peer support, information exchange and mentoring. The third and fourth case studies were guided by Aboriginal researchers and resulted in the development of the Birthing Business in the Bush Website, designed to decrease practitioners’ isolation from cultural knowledge. An integrated component of this Website is the Primary Health Care Guide to Planning Local Maternity Services, designed to decrease the isolation of the health care practitioner from the community in which they are working. Issues related to conducting research in the Australian Indigenous setting have been explored, analysed and detailed.
Each case study contributed new knowledge and learning about the challenges and contemporary contexts of remote area maternity service provision in Australia. The use of PAR, and, most particularly, how this can be used in Indigenous research to produce goals that extended beyond the individual researcher’s goals, has been described. The current difficulties associated with computer mediated communication, as experienced by remote practitioners, have been highlighted. The research has identified areas of need within the workforce that, if addressed, could contribute to improved health services.

Importantly, the research has documented, acknowledged, honoured and disseminated the voices of Aboriginal women, through the far reaching communication technology that is the Internet. Furthermore, the voices, concerns and conditions of remote maternity services providers were also documented and acknowledged. This workforce, often invisible and poorly valued, was assisted and supported to provide evidenced based, culturally appropriate maternity care, through the resources that were developed. To further progress the lessons taken from the research, recommendations have been developed and are listed in the Conclusion.
Prologue

PROLOGUE

Reasons for Undertaking the Study

Prior to 1990, like most non-Indigenous people in urban Australia, I had had very little interaction with Aboriginal people. In 1990 I worked in the maternity unit of Alice Springs hospital in Central Australia. I was struck by the awkwardness and loneliness I observed in the women who came in from the remote communities to birth at the hospital. The overwhelming impression I felt was that they did not want to be in the air-conditioned hospital, which, even to me always seemed so cold and sterile. Many women seemed more comfortable sitting outside in the warm environment under the trees. From Alice Springs I moved to Derby in the Kimberley region of Western Australia where I worked for the Royal Flying Doctor Service (RFDS). In my position as a flight nurse I was responsible for assisting in the transfer of people from their remote communities and small rural towns, into the regional centre, for health and maternity services. I was also involved in the provision of primary health care services whereby the doctor and I would fly out to remote communities, usually for one day only to provide services. Some of the communities did not have a resident midwife and I would spend my time in the community providing antenatal care and doing Well Women’s Checks.1

It was in Derby that I began to understand more about the issues that were important to some of the Aboriginal women who were being removed from their communities for birth. I recall going out to communities to collect women who had previously been sent in to Derby to await birth, but for various reasons, had returned to their community before birth. I often found that by the time we landed in their community the woman had already birthed. We would then transfer a well woman and baby in to Derby for no apparent reason. Anecdotally, some people working in the health service said it was ‘to teach them a lesson’. Since then I have worked in remote communities in Cape York Peninsula in Queensland and the ‘Top

1 Well Women’s Checks included a general health check with breast, cervical, sexual health and chronic disease screening.
Prologue

End’ of the Northern Territory (NT). My particular area of interest in these remote communities has always been women’s health and childbirth. However, I also found working in the remote setting incredibly frustrating. Women would want to birth in their home communities, yet this was not permitted. As a midwife I understood the importance of having family with you during this time, yet I could see the remote communities were not adequately resourced to provide birthing services. Maintaining appropriate staffing levels was an ongoing battle, with extraordinarily high turnover rates. I believed that providing birthing services for women in remote communities could be done safely, possibly with better outcomes, than many of the women were experiencing in the regional hospital. In addition, I believed that it would have improved both the birthing experiences for the women as well as my job satisfaction as a midwife.

During this 12 year period four different Area Health Services employed me across Western Australia, Queensland and the NT. I was given no more than a two-day orientation in each area, even when signing a two-year contract in the NT. To date, I have never had any formal cultural awareness training. Initially I was acutely ‘under prepared’ for the cultural environments in which I worked. At times my learning curve was steep, and at other times, it was frustratingly slow. Aboriginal Health Workers (AHWs) have taught me many things about their culture and their communities, and to them I will always be grateful. This was on top of their already full workload and as such, it should not have been expected of them.

Maningrida is a community in the ‘Top End’ of the NT where I worked for two and a half years. Molly Wardaguga is a retired Senior Aboriginal Health Worker (SAHW) who became my mentor in this community. After completing my time working in Maningrida, in 1999, I worked in the NT Department of Health and Community Services (DHCS) in the Women’s Health Strategy Unit. As a policy officer in this department I undertook a consultation about birthing services with women from remote areas in the ‘Top End’. I have drawn on some of the quotes from this consultation to illustrate certain points in the literature review. My next role was as the Women’s Health Educator (WHE) where I was responsible for supporting women’s health and maternity services across the Darwin Remote Region. It was in this position that I decided to do my doctorate. I wanted to explore ways to improve services to
remote Indigenous women. I realised that this required partnership with Indigenous women and decided to ask Molly Wardaguga if she would be prepared to work with me, thankfully she agreed.

My reasons for undertaking this research included a desire to strengthen the quality of remote maternity services for both the women and the practitioners. If Australian Aboriginal women win their battle to birth on their land, then I may have assisted to strengthen the environment for this to occur. By developing the resources that were the focus of the participatory action research (PAR) in the case studies, I also hope to shorten the learning curve of new midwives going out into these remote areas.

The principles of authoritative knowledge, Indigenous knowledge and primary health care have been used to examine the circumstances surrounding birthing for women in remote areas of Australia. Four case studies will be presented and critiqued within these frameworks. Each case study describes the development and evaluation of computer mediated communication strategies to reduce the isolation of the remote based practitioner. The first aimed to reduce isolation from educational resources (The Resource Library); the second to reduce isolation from peers (The Online Community); the third to reduce isolation from cultural knowledge (Birthing Business in the Bush Website); and the fourth aimed to reduce isolation from the community in which the practitioner is working (A Primary Health Care Guide to Planning Maternity Services in Your Community). All four resources are available via the Internet and the barriers and facilitators that influence the utility of strategies delivered in this way have been explored and described in each individual case study.

**Subjectivity of the Researcher**

The professional organisation that supports remote area nurses in Australia is called the Council of Remote Area Nurses of Australia (CRANA). I have been a member of CRANA for some time and was an active member of both the education committee and information technology committee. I was involved in writing the Maternity Emergency Course for non-midwives a multidisciplinary course with most participants being remote area nurses and Aboriginal health workers. This involves a self-directed learning package followed by a two
and a half day workshop for 20 participants. I have been a facilitator for the five courses that have been held to date and this has given me the opportunity to meet with remote practitioners from around the country. I have had many conversations with them about my doctorate and information technology resources in remote areas. This has provided an opportunity to promote the resources on which I was working. During the course of the doctorate I became a state representative for CRANA (2003) and then in September 2004, I became the vice president.
