Interfaces for Musical Expression Based on Simulated Physical Models

Andrew Johnston
University of Technology, Sydney

Submitted to the Faculty of Engineering and Information Technology in Partial Fulfilment of the Requirements for the Degree of Doctor of Philosophy

2009
Certificate of Authorship / Originality

I certify that the work in this thesis has not previously been submitted for a degree nor has it been submitted as part of requirements for a degree. I also certify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

List of Figures

2.1 Graph illustrating degree of mapping transparency for player and audience (Fels et al. 2002, p. 116). Expressive instruments will be transparent to both audience and player - positioned in the top right section of the graph. ................................................................. 13

2.2 Block diagram of a virtual instrument using a dynamic independent visual-mapping layer (Momeni and Henry 2006, p. 50). .......................... 30

2.3 A performance of Messa di Voce (the Bounce module). Here the vocalist Jaap Blonk is making cheek-flapping sounds which cause a stream of bubbles to be shown on screen as if emerging from his head. (Reproduced with permission.) .......................... 33

2.4 A still from the Fluid module of Messa di Voce showing a glowing fluid or plasma emerging from the performers’ mouths as they vocalise. (Reproduced with permission.) .......................... 34

2.5 Photograph of the Singing Tree at the Haus der Musik, Vienna. (Photograph by the author.) .......................... 35

2.6 Diagram showing mappings from the Matasaxophone sensors to parameters of ExBow physical models (Burtner and Serafin 2002, p. 138) 38

2.7 Diagram showing the relationship between live audio and acoustic and sensor data streams from the Metasaxophone in the piece S-TranceS. Note that although not shown here, the bowed string sounds are also convolved with one another, which adds further to the sonic complexity of the piece. ................................................................. 39

3.1 Overview of the research project. Processes are shown as clouds, concrete outcomes as boxes. .......................... 45

3.2 Crotty’s four elements of research (Crotty 1998, p. 5). ........................ 46

3.3 Action research cycle. .......................... 48

3.4 Overview of the design science approach to Information Systems research (Hevner et al. 2004, p. 80). While the emphasis is on ‘business needs’, the paradigm is of course also applicable in other domains. ........................ 52

4.1 Block diagram of a virtual instrument using a dynamic independent visual-mapping layer (Momeni and Henry 2006, p. 50). ................. 77
4.2 Mapping from the volume of the source sound to force acting on the simulated physical model. .............................................................. 80
4.3 The mass-spring model for Partial Reflections I. Circles represent masses and connecting lines represent springs. The smaller, shaded sphere's position is fixed, all others are mobile masses. ......................... 82
4.4 Ben Marks plays the virtual instrument for Partial Reflections I. Note the bright glow of some of the spheres indicating that they are currently having force exerted upon them. (Photo: Ros Hodgekiss) ............. 85
4.5 Ben Marks plays the virtual instrument for Partial Reflections I. (Photo: Ros Hodgekiss) ............................................................... 85
4.6 The mass-spring model for Partial Reflections 2. Circles represent masses and connecting lines represent springs. The smaller, shaded sphere's position is fixed, all others are mobile masses. ..................... 87
4.7 Photograph of performer and Partial Reflections II virtual instrument just before playing commences. (Photo: Ros Hodgekiss) ............. 87
4.8 Photograph of Ben Marks performing with Partial Reflections II virtual instrument. Note that due to the slow camera shutter speed, the photograph shows six masses on screen. Actually, to the naked eye, one mass was orbiting around the central point when this photo was taken. (Photo: Ros Hodgekiss) ......................................................... 90
4.9 Photograph of Ben Marks performing with Partial Reflections II virtual instrument. Here, two masses are orbiting the fixed central point. (Photo: Ros Hodgekiss) ................................................................. 90
4.10 Screenshot of Spheres of Influence in its resting state. ................. 92
4.11 Diagram of the physical model for the Spheres of Influence virtual instrument. Shaded circles are fixed masses, non-shaded circles are mobile masses and lines represent springs. The fixed masses around the outside are closest to the viewer, the fixed mass in the centre is in the far distance. The mobile masses (non-fixed) are positioned in between the outer fixed masses and the fixed central mass. None of the fixed masses are visible on-screen. ........................................... 92
4.12 Photograph of Ben Marks performing with the Spheres of Influence virtual instrument. (Note: This photograph was taken before the mapping between the harmonic structure of the acoustic sound and the colour of on-screen spheres was enabled.) (Photo: Ros Hodgekiss) . 94
4.13 Screenshot from the Spheres of Influence virtual instrument, illustrating how different visual colours are produced in response to acoustic sounds with different harmonic structures. .......................... 95
5.1 Demographic information collected from the musicians who participated in the study. .............................................................. 102
5.2 Whiteboard sketch showing the modes of interaction. Note that ‘ornamental’ mode was still characterised as an ‘effect’ at this stage of the analysis. ................................................................. 110
5.3 An arrangement of computer punch-cards labelled with modes of interaction and virtual instrument characteristics. These were used to help clarify and make coherent the emerging theory. .................. 111
5.4 Another arrangement of punch-cards, showing a number of desirable and undesirable virtual instrument characteristics as described by the musicians in the study. ............................... 111
5.5 Three modes of interaction mark boundary points of a map of interactions with a virtual instrument. ................................................................. 117
5.6 Virtual instruments which support conversational interaction facilitate a shifting balance of power between musician and virtual instrument. . 136
5.7 Sample page of notes taken by an observer present at the sessions. . 143
5.8 Summary of findings by the observers of the musicians’ interactions with Partial Reflections I. ‘1’ indicates the observer found clear evidence the criteria was met; ‘0’ indicates that the observer did not find evidence the criteria was met; ‘1?’ indicates that evidence was found but was incomplete or unconvincing (these are not counted in the totals).145
5.9 Summary of findings by the observers of the musicians’ interactions with Partial Reflections II. ‘1’ indicates the observer found clear evidence the criteria was met; ‘0’ indicates that the observer did not find evidence the criteria was met; ‘1?’ indicates that evidence was found but was incomplete or unconvincing (these are not counted in the totals).146
5.10 Summary of findings by the observers of the musicians’ interactions with Spheres of Influence. ‘1’ indicates the observer found clear evidence the criteria was met; ‘0’ indicates that the observer did not find evidence the criteria was met; ‘1?’ indicates that evidence was found but was incomplete or unconvincing (these are not counted in the totals).147
5.11 List of questionnaire responses. Numbers indicate degree of concurrence with statements (1 = strongly disagree, 2 = disagree, 3 = neutral, 4 = agree, 5 = strongly agree). ............................... 153
5.12 Mean values and standard deviations for each question. ............... 154
7.1 Overview of scanned synthesis. The performer manipulates a dynamic system (usually a mass-spring model) to change the shape of the audio waveform, thus directly affecting the timbre of generated sounds (Verplank et al. 2000, p. 368). ......................... 181
7.2 The physical model for PR3 was made up of 48 masses arranged in a circle. ............................... 184
7.3 Screenshot showing effect on the physical model when a middle C is sounded on an acoustic instrument. As with the other virtual instruments, the mass which was currently having force exerted upon it was also made to glow in order to aid transparency of operation.

7.4 During performance the structure of the physical model was altered. This screenshot shows the model after a number of links have been cut and the tension in some springs relaxed.

8.1 Overview of the research project. Processes are shown as clouds, concrete outcomes as boxes.
List of Tables

2.1 Summary of the taxonomy of effective instrumental gestures (Cadoz 1988, Cadoz and Wanderley 2000). These terms will be used in chapter 4 to describe the mapping between performers’ acoustic sounds and the resulting behaviour of the virtual instruments. ........................................... 25

4.1 Mass-spring model simulation parameters for Partial Reflections I. Note that the values shown here are unit-less, as the choice of units has no impact on the simulation. Simulation parameters are proportional in that a force value of 10 applied to a mass of 100 will have the same effect as a force of 1 applied to a mass of 10, provided the simulation rate is unchanged (Henry 2006). Thus while it is possible to conceive the mass as being in kilograms and the link length in meters if desired, this has no intrinsic meaning in the simulation. ........................................... 82

4.2 Summary of mappings from live audio to physical model in Partial Reflections I. .......................................................................................................................... 83

4.3 Summary of mappings from physical model behaviour to audio synthesis in Partial Reflections I. ..................................................................................................................... 84

8.1 A framework of design criteria informed by practice and research. ................................................................. 193
I am indebted to a great number of people who supported and encouraged me during this project. To my supervisors, Linda Candy and Ernest Edmonds, thankyou for giving me the freedom to explore and the intellectual and moral support to ensure that I did, eventually, produce a thesis.

To my colleagues Michael, Jim, Laurel and Bruce, thankyou for the many lunches during which we discussed family, philosophy, food, travel and general gossip. Thanks for the comradeship, the ideas and the laughs.

To all the researchers at the Creativity and Cognition Studios, past and present, thanks for providing such a vibrant, creative and interesting environment in which to work. There is nothing more rewarding than hanging around with smart people who are passionate about the things that really matter.

Special thanks to Ros for being such a good friend and a willing ‘guinea pig’ in the early stages.

To all the musicians who participated in the study, thankyou for being so willing to give up your valuable time and for providing such insightful comments and feedback. Without your help this project would not have been possible.

Ben Marks – mate your contribution has been enormous. Thanks for the inspiration and support, for being so open to new ideas and for your energy and generosity of spirit.

I have been incredibly fortunate to have been surrounded by inspiring musicians all my life. Foremost amongst them has been my father. Dad, thanks for the music – and so many other things. Mum, for the love, unstinting support and for being such a lovely Nana I will always be grateful.

Finally, to my beautiful girls: Emma, Zoe and Mia – you always put a smile on my face. Thankyou for supporting, enduring and inspiring this work. Love always.
Abstract
This thesis is concerned with the design of interactive virtual musical instruments intended to augment acoustic instruments in live performance. For the purposes of this work, a virtual musical instrument is defined as a computer system designed to facilitate musical expression and/or exploration. The aim of the research is to develop understanding of the nature of virtual instruments and how musicians interact with them. The approach has been to use participatory design techniques to develop a series of virtual instruments for use in live performance and then to examine closely the experiences of musicians who use them.

An interaction design strategy which uses simulated physical models to mediate between the sounds produced by acoustic instruments and computer generated sounds and visuals has been developed. In this approach, a simple physical system is modelled in software and characteristics of acoustic sounds are mapped to forces and other parameters which affect the model. In response the model moves in ways that are physically realistic. These movements are then used as parameters to control video and audio synthesis.

Using a research approach which draws on action research, design science and participatory design, a series of virtual instruments which use this interaction technique were developed and used in live performances. A set of initial design criteria which guided development were identified. In order to refine these criteria and better understand the impact that using these virtual instruments has on musicians’ music-making, a series of user studies were conducted. A number of expert musicians used the virtual instruments and discussed their experiences. These sessions were video-recorded, transcribed and analysed using grounded theory techniques.

The results of the study identified three modes of interaction with the virtual instruments: instrumental, conversational and ornamental. Musicians interacting with the virtual instruments in instrumental mode emphasise the importance of being in control and being able to trust that the instrument will respond consistently. When musicians use a virtual instrument ornamentally, they surrender detailed control of the generated sound and visuals to the computer, allowing it to create audio-visual layers that are added to the musicians’ sound. The more complex, (and difficult to design for) conversational interaction involves the sharing of control between the musician and the virtual instrument. The balance of power is in flux, allowing the virtual instrument to talk back to the musician, reflecting and transforming the sonic input in ways that move the performance in new musical directions.

The contributions of this thesis are therefore:-

- a set of virtual musical instruments which use a unique interaction paradigm in which simulated physical models mediate between live sounds produced on acoustic instruments and computer generated sounds and visuals;
- a theory of musician-virtual instrument interaction; and
- a set of design criteria informed by practice and user studies.
