

Variation in Neonatal Nurses' Conceptions of Competence in Their Practice: Implications for the design of learning experiences

Doctoral Thesis Submitted to the
Faculty of Education
University of Technology, Sydney

By

Jane Gudrid Davey
Nurse Educator
John Spence Nursery
Royal Prince Alfred Hospital

2002

Certificate of Authorship / Originality

I certify that the work in this thesis has not been previously submitted for a degree nor has it been submitted as part of requirements for a degree except as fully acknowledged within the text.

I also certify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition I certify that all information sources and literature used are indicated in the thesis.

Production Note:
Signature removed prior to publication.

Jane Davey

Acknowledgements

The completion of this thesis has been guided and supported by the contributions of many people.

First, to my supervisors Keith Trigwell and Mark Tennant who have guided me through the challenges of undertaking doctoral study. I thank you both for your patience, understanding, inspiration and numerous learning experiences.

Next, to fellow students Jo McKenzie and Anna Reid who have provided invaluable insights into conducting and presenting the results of phenomenographic research. Extra special thanks are extended to Jo for reading and commenting on earlier drafts of this work.

Trying to strike a balance between work and study is never an easy task. So, it is here that I must thank senior nursing management at Royal Prince Alfred Hospital, Sydney for their consistent support and creative rostering, in particular, Lynne Ramsay (Principal Director of Nursing), Valerie Smith (Coordinator Women's and Children's Health Nursing) and Janet Outlaw (Nurse Unit Manager – John Spence Nursery). Thanks must also go to nursing colleagues within John Spence Nursery, especially those who participated in the study and cannot be named here.

To medical colleagues within the Department of Neonatal Medicine thank you for acknowledging and supporting nursing research. To other colleagues within the Department, special thanks to Crista Wocadlo for reading and commenting on an early version of the literature review and to Leanne Dwight for exceptional help with typing and word processing.

Now to my friends and family, I cannot name you all here but I thank you for being part of a tower of strength throughout the ups and downs of this project. In particular, my husband Bob who has never stopped offering words of encouragement or doubted that I would reach this point.

Abstract

This study has examined the nature of competence in neonatal nursing practice from the perspective of neonatal nurses. It has also explored the type of educational support needed to help new graduates develop more complex and inclusive conceptions of competence in their practice of neonatal nursing.

Ideas about being and becoming competent in nursing practice have been informed by conflicting knowledge perspectives. The dominance of traditional research methods that have an underlying dualist ontology and objective epistemology has resulted in educational practices within nursing that separate the worker from the context in which the work occurs. Nurses have made attempts to overcome the limitations of these traditional methods by shifting toward research approaches concerned with the life-world of individuals. Much of this newer research however, has not addressed educational practices within nursing.

This study is situated within the life-world of neonatal nurses. The non-dualist phenomenographic approach was used to capture and describe variation in the way 20 neonatal nurses conceived of competence in their practice. Analysis of descriptions generated from unstructured interviews revealed four distinctive conceptions of competence in neonatal nursing practice. These conceptions are expressed as hierarchical internally related categories of description, with category IV being the most complex and inclusive.

- I Managing separate items within the NICU environment according to technology-based policy and procedural rules.
- II Managing integrated clusters of items within the NICU environment according to technology-based policy and procedural rules.
- III Managing a support system for the infant and family by using objective sensory observation of the infant to guide the use of policy and procedural rules according to priorities.
- IV Managing a support system focused on the infant and family by using objective sensory observation of the infant and tacit feelings about the infant arising from

variation in the previous experiences of outcome for infant and family to guide and challenge the use of policy and procedural rules.

Located within this hierarchy is the critical dimension of individual infant and family response. This response is highly contextual and consists of numerical, sensory and tacit aspects. It is postulated that learning activities should be structured to help new graduates entering the specialty of neonatal nursing to discern and focus on individual infant and family response. As such a learning framework (CONSERVE), based on this critical dimension has been proposed. Structuring learning experiences in this way should enable the development of more complex and inclusive conceptions of competence about the practice of neonatal nursing.

Using conceptual variation about competence in neonatal nursing practice highlights the importance of the relationship between the worker and the work. Moreover, it offers an alternative educational approach for new graduates entering the specialty of neonatal nursing that is both relevant and meaningful.
