THE GENESIS AND TECTONIC SIGNIFICANCE OF CHROMITITE-BEARING SERPENTINITES IN SOUTHERN NSW

Thesis submitted as a requirement of the Doctor of Philosophy degree,
University of Technology, Sydney
New South Wales, Australia

Ian T. Graham

1998
"I declare that the work presented in this thesis is the result of original research by the author"

Ian.T.Graham
ACKNOWLEDGEMENTS

Many people have provided help during the duration of this project and this is hereby acknowledged.

I would like to thank my co-supervisors, Adjunct Professors Brenda J. Franklin and Brian Marshall for the initiation of this project, their enthusiastic encouragement and support throughout its duration, and their numerous comments on the manuscript. They are also thanked for receiving the various grants, which were necessary to fund this research, and also, for undertaking all of the administrative work associated with these grants.

Professor Evan Leitch of the Geology Department is thanked for his comments on the manuscript, and especially, for his advice and comments on tectonics. Leightonie Hunt of the Geology Department is much appreciated for her help with the drafting of figures and tables, and most useful advice on working with Microsoft Word and Microsoft Excel.

Alan Giles of the Geology Department is thanked for his help with the production of thin-sections and polished mounts, advice on fluid inclusions, and for being a good mate. Rod Hungerford of the Geology Department is thanked for his help with the collection of samples for geochronological investigations, advice on beer, and particularly for being a good mate. Alan Buttenshaw of the Geology Department helped with computer problems and is also thanked for letting me use his laser printer. Dr Edgar Frankel of the Geology Department is very much thanked for his support and encouragement throughout the duration of this project. Dr Graziella Caprarelli of the Geology Department is thanked for her advice and comments on the Nd-Sm isotope results.

David Colchester is thanked for sharing his great practical knowledge on XRD analysis and mineralogy. Maree Anast is thanked for her advice and help with XRD analysis. Mathew Phillips and Ric Wuhrer of the Microanalysis Unit of the Faculty of Science are thanked for their advice and guidance on Scanning Electron Microscopy.
Jeff Davis from the CSIRO Division of Exploration and Mining, North Ryde is thanked for his advice and help with sample preparation and zircon grain separation. Dr John McAndrew is thanked for his advice on the mineralogy, chemistry and analysis of chromitites. Helen Waldron and Brian Garnett of Becquerel Laboratories, Lucas Heights, are thanked for their advice on Neutron Activation Analysis. Mark Fanning of the RSES, ANU, is thanked for his advice on the age-dating of the plagiogranites. Helena Basden from the Geological Survey of NSW is very much thanked for sharing her vast knowledge of the Tumut region.

Paul Jones, Dieter Bruggermann, Somaly Srey, Piers Reynolds, James Wilson, Robert Parker, Paul Cheadle and Jane Giddey, all former undergraduate students within the Geology Department of UTS, are very much thanked for their help and companionship in the field.

My sister, Tina Graham, is thanked for her help with photocopying and advice on Microsoft Word and Microsoft Excel, while my brother Paul is thanked for lending me the money when it was needed.

My friends, Andrew, Julie, Paul, Barbara, Dion, Doug, Ross, Tony, Terry and David are thanked for providing distractions when I needed a break. Scott and Martin are thanked for the distracting and competitive golf. My niece, Breannan, and nephew, Conor are also thanked for distracting me during their visits.

Funding was provided by an Australian Postgraduate Research Award. Work on the podiform chromitites was funded by a joint CSIRO/UTS co-operative research grant. The neutron activation analyses were funded by grants from ANSTO while, funding for the geochronological investigations was provided by an internal UTS research grant. Financial support for attending conferences in Australia and overseas was provided by grants from the UTS Vice-Chancellors postgraduate student conference fund, the Geology Department at UTS, and the NSW Division of the Geological Society of Australia.

Finally, most of all I would like to thank my parents, Paul and Hilary Graham, for their continual support and encouragement throughout my life, especially in times of hardship.
ABSTRACT

The Tumut Serpentinite Province consists of four major serpentinite belts and numerous small serpentinite bodies, that occupy a long narrow tract within the Lachlan Fold Belt of southern NSW. The tectonic setting of one belt, the Coolac Serpentinite Belt, has been contentious. Much of the uncertainty results from lack of a combined study on the major belts and inadequate age constraints. Resolving the uncertainty will benefit construction of a tectonic model for the evolution of the Lachlan Fold Belt.

The belts mainly comprise massive serpentinite or harzburgite, with internal shear zones of schistose serpentinite, and intrusions of plagiogranite, gabbro, basalt, pyroxenite, dunite and chromitite. The main foliation has a consistent NNW-SSE trend and is similar in the adjacent rock units. The various rock types of the serpentinite belts are geochemically akin to similar rocks from ophiolite sequences.

Podiform chromitites are geochemically, mineralogically and geometrically akin to those in the mantle sequence of most ophiolites. The different chromitite types are interpreted in terms of the degree of evolution of the MORB-type magma and hence the extent of fractionation of the source. Serpentinisation and rodingitisation occurred during progressive cooling of the chromitites and host rocks and were accompanied by systematic fracturing and remobilisation of chemical components.

Radioisotope dating gives an age of crystallisation of 412-400 Ma for the plagiogranites and leucogabbros, whilst an inherited zircon age of 430 Ma appears to be derived from Early Silurian felsic volcanic rocks of the region. As the plagiogranites, leucogabbros and other rock types within the serpentinite belts have common deformational and metamorphic histories, their crystallisation age constrains the ages of deformation and metamorphism.

The serpentinite belts are interpreted as ophiolites of the ‘embryonic’ type that formed within a back-arc basin setting in the Late Silurian-Early Devonian. Crystallisation of the MORB sequence and emplacement onto continental crust, together with metamorphism and deformation may have only spanned 20 Ma. In the Late Silurian to Early Devonian, the Tumut Serpentinite Province
differed from basins elsewhere within the Lachlan Fold Belt in that a volcanic arc was ruptured by mantle-derived MORB magmas which ascended to the surface. Their extrusion was short-lived and after the Early Devonian, the development of the Tumut region differed little from that in the rest of the Lachlan Fold Belt.

The development of oceanic crust within the Tumut Serpentinite Province and the generation of granitic magmas within the central and eastern parts of the Lachlan Fold Belt are symptomatic of the same Late Silurian to Early Devonian tectonothermal event. An important aspect of this is that oceanic and crustal rocks need not form from different events or in substantially different tectonic settings.

8.9 Rodingites
8.9.1 Major and minor element geochemistry
8.9.2 Variation diagrams
8.9.3 REE and trace element geochemistry
8.9.4 Discussion

8.10 Unusual rock types
8.10.1 Major and minor element geochemistry
8.10.2 Variation diagrams
8.10.3 REE and trace element geochemistry
8.10.4 Discussion

8.11 Conclusions

CHAPTER 9: GEOLOGY AND GENESIS OF THE PODIFORM CHROMITITE DEPOSITS

9.1 Introduction
9.2 Field relationships
9.2.1 Mount Lightning Adit (MLA) deposit
9.2.2 Quilter's Open-Cut (QOC) deposit
9.2.3 Mount Miller (MM) deposit
9.2.4 Observations from other deposits

9.3 Textural studies
9.3.1 Mesoscale observations
9.3.2 Micro-scale observations

9.4 Bulk chemistry of the chromitites and associated dunitic wallrocks

9.5 Probe chemistry of the chromite grains
9.6 Primary inclusion mineralogy 313
9.7 Fracture-fill mineralogy 317
  9.7.1 Metallic phases 317
  9.7.2 Oxide phases 321
  9.7.3 Silicate phases 324
9.8 Previous models for the genesis of podiform chromitite deposits 326
9.9 Features of the Tumut Serpentinite Province chromitite deposits 330
that must be explained by any genetic model 330
9.10 A genetic and evolutionary model for the Tumut Serpentinite Province chromitites 331
  9.10.1 Discussion 331
  9.10.2 The proposed model 339
9.11 Conclusions 341

CHAPTER 10: GEOCHRONOLOGICAL INVESTIGATIONS 342
10.1 Introduction 342
10.2 U/Pb zircon isotope studies 342
  10.2.1 Introduction 342
  10.2.2 Sample collection 343
  10.2.3 Geology of the sample sites 343
  10.2.4 Petrography 345
  10.2.5 Sample preparation and analytical procedure 346
  10.2.6 Results 346
10.3 Nd/Sm isotope investigations 353
  10.3.1 Introduction 353
  10.3.2 Sample selection 353
  10.3.3 Geology of the sample sites 353
  10.3.4 Petrography 362
  10.3.5 Sample preparation and analytical procedure 367
  10.3.6 Results 367
10.4 Discussion 370
10.5 Conclusions 375

CHAPTER 11: DISCUSSION, INTERPRETATION AND CONCLUSIONS 376
11.1 The serpentinite belts: a summary 376
11.2 Are the serpentinite belts ophiolitic fragments? 380
11.3 How may the U-Pb SHRIMP data be interpreted? 387
11.4 How else can the serpentinisation, metamorphism and deformation 389
  of the serpentinite belts and associated rock units be constrained? 389
11.5 The genesis and evolution of the serpentinite belts within the 391
  Tumut Serpentinite Province 391
11.6 Conclusions 400

7.7 Contact between plagiogranite (left) and metabasalt enclave (right).
Sample No 169a

7.8 Narrow cataclasite zone within plagiogranite.
Sample No 169b

7.9 Albite-epidote-zoisite-chlorite metamorphic assemblage in metabasalt.
Sample No BF92/15b

7.10 Laminar banded texture of meta-dacitic tuff.
Sample No WW4 (b)

9.1 Typical outcrop of the podiform chromitite deposits. Outcrops are serpentinised harzburgite. Locality 37, near Pettits. Viewed from the east.

9.2 Chromitite fragments within rodingite dyke of the MLA deposit. Viewed from the north-east.

9.3 Quilter’s Open-Cut, viewed from the north-east. Outcrop on the walls consists of blocks of unsheared harzburgite within serpentinised dunite.

9.4 Diffuse-margined core of unsheared harzburgite within serpentinised dunite. QOC deposit, viewed from the north-west.

9.5 Small tabular chromitite body within serpentinised dunite. QOC deposit, viewed from the west.

9.6 Chromitite veins within serpentinised dunite. QOC deposit, viewed from the west.

9.7 Disseminated chromitite from the MLA deposit.
Sample No MLA019

9.8 Aggregates of chromite within disseminated chromitite from the MLA deposit.
Sample No MLA013

9.9 Banded disseminated chromitite from the MLA deposit.
Consists of an upper dunite layer, and underlying chromite-rich band passing downward into disseminated chromitite.
Sample No MLA017

9.10 Nodular chromitite from the MLA deposit.
Sample No MLA011

9.11 Massive polycrystalline chromitite from the MLA deposit.
Sample No MLA018
9.12 Compact microbreccia from the QOC deposit.  
Sample No QOC003

9.13 Chromite-olivine pseudo net texture from the MLA deposit.  
Sample No MLA014

9.14 Well-developed massive polycrystalline chromitite from the MLA deposit.  
Sample No MLA010

9.15 Orthogonal systematic fracturing within massive polycrystalline chromitite from the MLA deposit.  
Sample No MLA018

9.16 Cataclasis with negligible fracture offset from the MLA deposit.  
Sample No MLA007

9.17 Tiny prismatic subhedral heazlewoodite grain (arrowed) in fracture-fill chrysotile within chromite. MLA deposit.  
Sample No MLA006

9.18 Crush microbreccia from the QOC deposit.  
Sample No QOC003

9.19 Dilation without significant fragment rotation within chromitite breccia from the QOC deposit.  
Sample No QOC001

9.20 SEM image of PGE-bearing pentlandite inclusions within chromite from McAlpine’s chromitite deposit.  
Sample No DBChrom

9.21 SEM image of Al-spinel inclusions within Cr-rich chromite.  
Sample No 133

9.22 SEM image of euhedral pargasitic amphibole inclusion in chromite.  
Sample No 36

9.23 SEM image of sharp contact between the pargasitic amphibole inclusion and host chromite.  
Sample No 36

9.24 Composite silicate/Ni-sulfide inclusion in chromite.  
Sample No 138d

9.25 SEM image of discrete grains of awaruite in fracture-fill serpentine between chromite grains.  
Sample No 69h
9.26 SEM image of composite awaruite (white)/trevorite (dark grey)/magnetite (light grey) grain within fracture-fill.
Sample No MC015

9.27 Discrete grain of subhedral equant millerite (arrowed) within fracture-fill.
Sample No MLA007

9.28 SEM image of euhedral prismatic heazlewoodite in fracture-fill.
Sample No MLA008

9.29 SEM image of palladian gold (bright white) within fracture-fill.
Sample No 69

9.30 Fracture-related replacement of primary chromite (grey) by ferritchromit (pitted yellow-white).
Sample No MLA007

9.31 SEM image of fracture-related replacement of primary chromite (dark grey) by ferritchromit (pitted white).
Sample No 138b

9.32 SEM image of fracture-related replacement of primary chromite (dark grey) by ferroan chromite (light grey) and ferritchromit (pitted white).
Sample No 138b

9.33 SEM image of intergrowth of ferritchromit (white) and serpentine (black).
Sample No 138b

9.34 SEM image of reaction front of ferritchromit (white) replacement of primary chromite (grey).
Sample No 138b

9.35 Fracture-fill diopside (dark grey) and serpentinised olivine (black) within chromite (light grey).
Sample No 137b

9.36 SEM image of replacement of fracture-fill diopside (light grey) by serpentine (black) within chromite (white).
Sample No 69b

10.1 Cathodoluminescence image of zircon grains 1 and 2 from sample BF91/20.

10.2 Cathodoluminescence image of zircon grains 4, 6 and 14 from sample BF91/33f.

10.3 Cathodoluminescence image of zircon grains 6, 7 and 8 from sample 238.

10.4 Cathodoluminescence image of zircon grain 9 from sample 238.

(b) WSB chromitites (data from Table 9.4) 
(c) Other ophiolite chromitites  
(chondrite values are those of Naldrett & Duke 1980).  309

Figure 10.1  Location of the sample sites for U/Pb geochronology.  344

Figure 10.2  Composite Tera-Wasserburg concordia plot for the SHRIMP 
analyses of zircons from samples 238 (circles), 29 (triangles), 169 PLAG6 
(inverted triangles), 189 (squares) and BF91/33f (diamonds). Analyses 
plotted, uncorrected for common Pb, with one sigma bar errors. A weighted 
mean of the 207Pb corrected 206Pb/238U ages for 38 analyses gives a pooled age 
of 401.3 ± 3.4Ma (shaded symbols). Some 10 analyses are older at 
431 ± 8Ma (striped symbols).  350
