School of Computing and Communications

Modelling and Development of Wireless Inertial Measurement Units

By

Yu, Zhengyu

Supervisor: Zenon Chaczko

Course Code: C03017

February 2014

Submitted in fulfilment of the requirements for the degree of Master of
Engineering Research

CERTIFICATE OF AUTHORSHIP/ORIGINALITY

I certify that the work in this thesis has not previously been submitted for a degree nor has it been submitted as part of requirements for a degree except as fully acknowledged within the text.

I also certify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

Signature of Candidate

ACKNOWLEDGMENTS

Firstly, I would like to express my sincere gratitude to my supervisor, Dr Zenon Chaczko, who has supported me in this work for the past 4 years. Zenon, you have been more than a supervisor to me during that time. In particular, you have been with me every step of the way throughout this research and have supported me during every stressful moment that I experienced. I greatly appreciate your clear guidance and feedback.

Secondly, I would like to thank my parents; You have been taking care of me for the whole life. Every time when I am stressful, you help me to deal with the pressure. During my study life, you encourage me a lot to achieve a higher academic result. I love you.

Also, I would like to thank my dear friends, Jiajia Shi and Andy Wei, for sharing their knowledge and lab equipment. Accept my best wish for your research projects and academic publications.

I am very thankful to UTS staff, who has supported my research work for the past 4 years. To Dr Xiaoying Kong, Prof Robin Braun, and A/Prof Sandrasegaran Kumbesan, thank you so much for delivering research seminars and presentations in the past two years. I have learned the most up-to-date technology, concepts and research information in these presentations.

Last but not least, I would like to thank to my family and friends, who have always been there for me, providing support and encouraging me. I could not have got this far today without your help.

ABSTRACT

This thesis presents the design and test of a wireless sensor mounted inertial navigation system. The innovative, low-cost and effective inertial measurement unit is based on three-axis accelerometer with USB and the serial direct interface. The accelerometer has connectors on both side of the module for control and communication. Wireless sensor, Bluetooth, has been mounted on the inertial navigation system to facilitate communications. By using this solution, it is possible to monitor and update the data of the accelerometers wirelessly and synchronously. The collected wireless data are analysed and compared with the data from other sources, such as USB cable, to determine errors in the system. The work discusses issues related to the accelerometer system technology, demonstrate application and process experiment. Particular consideration is given to the development of wireless technology and to a new micro-electro-mechanical accelerometer system test facility.

The main contributions of this thesis are as follows:

- Development of a wireless inertial measurement unit
- Development of an error model
- Implementation of this inertial measurement unit into a gyro-free inertial navigation system
