CERTIFICATE OF ORIGINAL AUTHORSHIP

I certify that the work in this thesis has not previously been submitted for a degree nor has it been submitted as part of requirements for a degree except as fully acknowledged within the text.

I also certify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

Signature of Student: Gabriel Pereira Pündrich

Date: 05/05/2014

Production Note:
Signature removed prior to publication.

Gabriel Pereira Pündrich

ACKNOWLEDGMENTS

I would like to express the deepest appreciation to the support of my principal supervisor, Professor Andrew Ferguson. Thank you for this opportunity, your guidance, motivation and mentoring during all these years. Without your supervision and constant help this dissertation would not have been possible.

I would like to thank the assistance of Dr. Peter Lam and Dr. Robert Czernkowski, particularly in regards to editorial advice. I also benefited from the advice and help of my fellow PhD students: Alexey Feigin, Adrian Raftery, Thomas Scott, Matt Grosse, Stephen Kean and Nelson Ma. Thanks to all the help from UTS staff members, students, and visitors. I also acknowledge receiving financial support from UTS.

I also acknowledge the editorial advice of Mark MacLean, whose editorial service was paid for by the UTS Editing of Thesis Fund.

I would also like to thank Professor Dan Collins for inspiring me to do both interesting and rigorous research. Many thanks for the friendship and support from the University of Iowa PhD students, including Bradford Hepfer, Katie Hepfer, Gerrit Lietz, Phillip Quinn and Steven Savoy.

Special thanks to friends who made me feel at home in Australia: Francesco Giacobbe and family; Fabio Iskandarian; Nathalia Zuckerman; Camila Tree; Alex Barcelos; Heloisa Hertzog; Guilherme Ramos; Rossana Ruschel; Damian Ham and Tatuira.

Last and most importantly, I dedicate this thesis for my family, whose support and love was fundamental to go through this journey. Thanks to Ricardo Pündrich, Vera Lucia Pündrich, Elaine Pündrich, Aline Pündrich, Leandro di Domenico and Luca di Domenico.

ABSTRACT

Previous studies in the financial economics literature highlight the value of non-financial information to investors for Internet and telephony stocks (Amir and Lev 1996, Trueman, Trueman and Zhang 2001). Other studies consider the financial performance implications of assurance of non-financial information such as ISO 9000 certification (Corbett, Montes-Sancho and Kirsch 2005) and Total Quality Management awards (Hendricks and Singhal 1997). This thesis provides evidence on the value of non-financial disclosure and assurance in a high information asymmetry setting. Specifically I examine market reactions to resource/reserve disclosures by Australian Mining Development Stage Entities (MDSEs) and the reputational effect of geological experts associated with these disclosures. I might expect geological assurers to matter given that the information environment of MDSEs is characterised by high information asymmetry and the reality that non-financial technical information supersedes financial statement information in terms of importance in firm valuation. In contrast however, the litigation risk attached to such disclosures is argued to be very low, given the absence of cases involving geological attestors. This aspect of the setting suggests the absence of any insurance effect, which might suggest geological assurers won't matter to the market.

Public accounting firms audit and review financial figures compiled by a client. Essentially, the role of auditors is to ensure compliance with Generally Agreed Accounting Principles (GAAP). In contrast, geological assurers are unique in that they receive mineral assay data from clients and then compile the resource estimates that are subsequently announced by the client firm to the market. Thus geological assurers have an information generation role along with a compliance role in that they are required to produce estimates in accordance with the Joint Ore Reserve Committee (JORC) code.

In this thesis I document a significant, positive market reaction to resource/reserve disclosures by MDSEs. Using size of geological experts as a proxy for their reputation, I find weak evidence of greater abnormal returns when these disclosures are assured by larger geological experts. Further, a measure of expert specialisation based on commodity cluster leadership produces the strongest positive and significant results. In supplementary analysis, I test for the implications of switching geological experts and find that firms experience significant, positive abnormal returns when their successor expert is larger. Overall, the weak evidence I documents in this thesis is consistent with an insurance effect interpretation, in that the reputation of geological assurers doesn't matter to the market where litigation risk is low.
