

Understanding the effectiveness of open standards for providing access to functions in Next Generation Networks

by

Samson Lee

A thesis submitted in partial fulfillment for the
degree of Doctor of Philosophy

in the

Faculty of Engineering

University of Technology, Sydney

April 2009

Certificate of Authorship

I certify that the work in this thesis has not previously been submitted for a degree nor has it been submitted as part of requirements for a degree except as fully acknowledged within the text.

I also certify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

Abstract

The traditional telecommunications environment is ‘closed’, where applications can only be developed internally with specific knowledge of individual network technologies. In the last several years, there has been an enormous increase in efforts to ‘open up’ these networks for application development, leading to open standards such as the Parlay/OSA APIs. This thesis is primarily concerned with understanding the effectiveness of open standards for providing third party stakeholders with access to functions in Next Generation Networks. Effectiveness in this context is to do with how well open systems may, and can, enable the business aims, and consequent technological advantages to achieve the business aims. We reason about the effectiveness from three perspectives in terms of whether the open standard provides sufficient openness, functional coverage, and practicality. While the methodology and models are applicable to evaluating open standards in general, we specifically apply them to the QoS control functionality provided by the Parlay/OSA Connectivity Manager Service Capability Feature.

Acknowledgements

Sincerest thanks to my supervisors, Prof. John Leaney and Dr. Tim O'Neill for their guidance and encouragement throughout my candidature. Tim, the ~~hill~~ mountain was long and steep, but we saw the finish line and got there in the end! John, I am so grateful of your continual support even in the face of a challenge as tough as leukemia—you are truly an inspiration.

This research would not have been possible without industry support from Alcatel Australia—acknowledgments to Mark Hunter especially for your involvement in the MEEN project. Also thanks to Prof. Robin Braun, Dr. Kumbesan Sandrasegaran, Shmuel Markovitz and Zenon Chaczko from the University of Technology, Sydney, whom I had the pleasure of working with as part of the project.

The work from this thesis has resulted in several internationally peer reviewed papers. I would like to thank all the anonymous reviewers for their comments. Their feedback and suggestions have helped in improving the quality of the papers, which have been reflected back into this thesis.

Of course, I also want to thank my fellow PhD students who kept me company on level 22 for many of the years. Nigel, David, Jacqui, Shane, Roy and Mark, I hope that our paths will cross again soon.

Lastly, to my wife, Becky, you've been by my side throughout the entire journey. Thanks for putting up with me, and I really do appreciate all the little things you always do for me.
