## **Acknowledgements**

Undertaking this research has been a privilege for me, and I am deeply grateful for the assistance of a number of people, without whom I would not be in the position of submitting.

Firstly to the Director of Nursing at the Regional hospital in New Zealand who approved my entry into the hospital, then the Charge Nurse of the Children's ward who accepted my presence unconditionally and was supportive and helpful throughout the field work phase, and finally the nurses and parents in the ward who read the information for participants sheet and then said 'yes' when I asked to observe them, talk to them and listen to their experiences. I was continually amazed at the willingness of all the participants to be involved in this study; my grateful thanks to you all.

Secondly to Professor Jane Stein-Parbury at UTS for taking me on, listening to me, supporting me and encouraging me every step of the way in this process. I am so appreciative of her timely and expert advice, and the gracious way she shared her wisdom with me. Dr. Denise Dignam has also been there for me from the beginning, believing in me and providing succinct, thoughtful appraisal of my work. Thank you.

Thirdly my thanks to my family: my ever-tolerant husband John, who has stood beside me throughout this journey, keeping the home fires burning and always believing I would succeed; my sons, Sergei and Alexander who have been a rock of sanity when I needed them, providing encouragement and support; to my parents, Marion and Jim Crawford who gave me a secure base from which to embark on life, and always encouraged me to have no limits on 'my best'; and my siblings Barbara and Andrew and their families, who have supported and listened to me, many thanks.

Finally I owe thanks to the management at the Eastern Institute of Technology who have given me time to write, financial support and a listening ear. Thank you to the Hawke's Bay Medical Research Foundation Inc. for financial support. Many thanks to Jenni Coulson who helped with the concept drawings. I am also indebted to library staff at the Twist Library at EIT, in particular Sharon Johansen and Linda Mellor, and IT staff Kylie Stevens. Lastly my thanks to Bianca Wohlers for her editing support.

## **Abstract**

---

In contemporary child healthcare, there is an expectation that parents will be involved in the child's care and work collaboratively with nurses. Collaboration such as this requires that nurses relate to and communicate with both the child and parents. The central concern of this study is emotional communication between the nurse and parent, focusing on parent's feelings and affective responses as they are related to their child's hospitalisation. The aims of the study were to investigate nurses' and parents' experiences of this aspect of communication within the environmental and cultural context of the parent-nurse interaction.

A focused ethnography was conducted, given the importance of understanding the cultural context of nurse-parent interaction. Data collection occurred in a children's ward of a New Zealand hospital, and involved 280 hours of participant observation field work over 22 weeks, 228 informal interviews with parents and nurses, followed by 20 formal interviews with nurses and parents. Data analysis occurred simultaneously as data were interpreted inductively throughout collection.

The findings support the impact of ward and nursing culture as an influence that shapes nurses' behaviour and affect. Parents of a child in hospital were in a vulnerable position, required support and looked to nurses for an interpersonal connection. Parents wanted nurses to provide support and guide them through the hospitalisation journey, acting as cultural brokers. Nurses recognised and responded to parents' need for informational and instrumental support, however there was little acknowledgement that parents also needed emotional support. Nurses responded to parents' overt displays of emotion, but did not elicit emotional expression. The emotional labour that is required by nurses to manage both parents and their own emotions led nurses to engage in self-protection actions. The cultural context of the ward impacts emotional communication between parents and nurses, inhibiting and governing parents' actions and nurses' responses.

This work contributes to further understanding of the concept of cultural brokerage in nursing practice. Eliciting, acknowledging and confirming parents' emotional concerns are core elements of nurses' emotional communication. Organisations must value the labour required to emotionally support others, and recognise the vulnerability of parents and nurses as they work together on their mutual goal of improving the well-being of the child-patient.
