

Real-time Performance Analysis of Mobile Networks for Emerging Services in UMTS/HSDPA

A Thesis Submitted to

University of Technology, Sydney

by

Lu Chen

Supervisor: A/Prof. Kumbesan Sandrasegaran

March, 2011

In Partial Fulfilment of

the Requirements for the Degree of

Master of Engineering by Research at
Faculty of Engineering and Information Technology

University of Technology, Sydney

New South Wales, Australia

CERTIFICATE OF ORIGINALITY

I certify that the work in this thesis has not previously been submitted for a degree and it has not been submitted as part of requirements for a degree except as fully acknowledged within the text.

I also certify that all the contents in this thesis have been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

Signature of Candidate

Production Note:

Signature removed prior to publication.

ACKNOWLEDGEMENT

First of all, I would like to express my gratitude to Dr. Kumbesan Sandrasegaran, who inspirited me and offered me the opportunity to conduct this research project in the field of telecommunications. This research work would not have been possible without continuous guidance, encouragement, constructive feedbacks, supervision, knowledge and overall support from him. This research project has helped me tremendously to build my knowledge and background regarding mobile communications. Moreover, it is greatly appreciated that the opportunities he gave me to be a guest lecturer for the subject of 3G Mobile Communication System subject in 2010. This preparation and practice of lecturing has helped me in discovering the deficiencies of knowledge, inspired and motivated me of performing responsible studies and research, and also enriched my personal experience. The rigorous scholarship and diligence reflected on Dr. Sandrasegaran have had significant influence on me.

My special thanks would go to my research assistant, Mr. Riyaj Basukala, and my colleague Miss Minjie Xue. Mr. Riyaj Basukala has provided practical assistance in carrying out most of the measurements as well as in data analysis work. Moreover, the proofreading work of this thesis has been done by Mr. Basukala, which is very much appreciated. Miss Minjie Xue was generous in sharing her experience and knowledge. The discussions with her were inspirational and pleased. Miss Xue has participated in the proofreading of this Chapter 2 and Section 4.1.1 in this thesis.

I would like to extend my thanks to Prof. Robin Braun, Dr. David Davis and Dr. Xiaoying Kong, for their valuable advices on research methodologies. Dr. Kong has also influence me by her positive attitude and great passion to her research work and to life.

Many appreciations are paid to the numerous members of support staff who have made the technical and field measurement parts of my work possible.. Special esteem goes to the help and concern from my colleagues at the Centre for Real-Time Information Networks (CRIN), Miss Huda Adibah Mohd Ramli, Mr. Cheng-Chung Lin, Mr. Rachod Patachaianand, Miss Mehrnoush Masihpour, and Miss Samaneh Movassaghi. The friendly and collaborative research atmosphere they created was valuable and appreciated. I would also give my sincere thanks to my friends, Miss Xin Wang and Miss Xu Zhang, who provided me great encouragement as well as beautiful friendship during the pursuit of my ME degree.

Finally, with my love and gratitude, I want to dedicate this thesis to my parents who have supported me throughout my study endeavor here in Australia.

ABSTRACT

Whereas the network performance in terms of service capabilities and spectrum efficiency has been significantly improved due to the advanced mobile networks and technologies, the inherent high-interference due to the air interface of the Radio Access Networks (RAN) and varying Quality of Service (QoS) requirements per service per user are continuously challenging the performance of mobile cellular networks. The network performance can be measured and analysed by selected Key Performance Indicators (KPI).

To further study mobile network performance in the context of provisions of services, computer simulations are commonly used for modeling and optimisations. However, the mobile network performance obtained during real-time measurements is very dependent on the particular service, location, network/service providers, infrastructure, user equipment, dynamic change of mobile traffic density and so on, while the simulation environment is largely based on assumptions and simplifications of the real-world scenarios.

Therefore, this thesis focus on investigating the real-time performance measurements of commercial WCDMA and HSDPA networks for emerging multimedia services, such as video telephony and video streaming. Moreover, this thesis provides the feasibility of using real-time performance measurements as a supplementary research methodology and finally implementing the methodology to make more accurate and realistic MATLAB-based computer simulations for WCDMA and HSDPA RRM functionalities.
