

Designing Collaborative Workspaces for Particular Complex Work Settings

Yingjing(Jane) Li

A thesis submitted for the degree of Doctor of Philosophy in
Computing Sciences

Faculty of Engineering and Information Technology
University of Technology, Sydney

February 2016

Certificate of Authorship/Originality

I certify that the work in this thesis has not previously been submitted for a degree nor has it been submitted as part of requirements for a degree except as fully acknowledged within the text.

I also certify that the thesis has been written by me. Any help that I have received in my research work and the preparation of the thesis itself has been acknowledged. In addition, I certify that all information sources and literature used are indicated in the thesis.

Acknowledgements

This research work has been a long journey. The completion of this work would not have been possible without the support of many people whom I would like to thank sincerely.

To Professor Toni Robertson, my supervisor, thank you for your guidance, inspiration, input and encouragement. I appreciate your constructive advices which helped me to establish the overall direction of this research and your suggestions which inspired and challenged me to explore my research in depth. You constantly helped me by pointing out the weaknesses in my work and by guiding me to clarify my ideas. I have been fortunate to have worked with you since my early years of research at CSIRO and throughout the journey of my PhD. Your guidance and encouragement have helped me grow, both personally and professionally.

To Adjunct Associate Professor Duncan Stevenson, my advisor and former CSIRO scientist, thank you for your mentoring and continuous support. I am grateful that you shared your extensive research knowledge and experience with me and helped me better understand the results of my explorations. I appreciate your detailed feedback which has greatly improved the robustness of my thesis.

To Dr Christian Mueller-Tomfeld, Dr Kenton O'Hara, Susan Hansen and Dr Alex Hyatt, former CSIRO scientists, and to Dr Tim Mansfield, former NICTA researcher, whom I worked closely with in the studies that are presented in this thesis, thank you for all your invaluable contributions to the field studies, data analysis and writing of papers. Your knowledge and insights have greatly helped shape my research.

To my CSIRO managers and colleagues, Dr Laurie Wilson, Dr Jesper Kjeldskov, Dr Leila Alem, Dr Jill Freyne, Dr Dimitrios Georgakopoulos, Dr Sarah Dods, Dr Trevor Bird, Dr David Hansen, Dr John Zic and Narelle Clark, thank you for giving me a supportive environment to enable me to pursue my doctoral degree. Your understanding and encouragement are gratefully acknowledged.

To the members and associates of the Interaction Design and Human Practice Lab at the University of Technology, Sydney, thank you for your friendship and support. I am grateful that I did my PhD in this wonderful academic environment. Special thanks to

Dr Julia Prior, Dr Jeni Paay, Dr Lian Loke, Dr Tuck Leong, Dr Penny Hagen, Dean Hargreaves, Jeannette Durick and Anita Gisch for your company during my PhD journey.

Most of all, to my husband Kai, my two children and my parents, I would never have gone this far without your love and support.

Table of Contents

1	Introduction	1
1.1	Background.....	1
1.2	Research Context – Designing Collaboration Technologies.....	4
1.3	Challenges in Supporting Distributed Collaboration.....	6
1.4	Research Questions and Objectives.....	8
1.5	Research Approach and Three Case Studies	10
1.6	Summary of Findings and Contributions.....	11
1.7	Structure of the Thesis	13
2	Supporting Distributed Collaboration - Literature Review.....	15
2.1	Distributed Collaboration, Interaction and Design	16

Abstract

This research explores how new collaboration technology can be designed to enhance distributed collaboration in particular complex work settings. Collaboration in work environments increasingly involves complex interactions between individuals and teams working across geographical, institutional and professional boundaries. This research addresses the challenges of supporting real-time communication and information sharing between different teams and across variable local settings. These issues are explored within the context of developing collaborative workspaces which integrate sophisticated video conferencing and information sharing technologies in multi-display environments. This research aims to understand the characteristics of interactions that a collaborative workspace needs to support and how to design a collaborative workspace for collaboration across different local settings without compromising the integrity of local work practices.

The research issues were explored through three case studies in three work domains: multidisciplinary medical team meetings in two hospitals, collaboration in a national committee responsible for the emergency response to animal disease, and scientific collaboration across containment barriers in a biosecurity laboratory. Workplace studies were conducted in each of the studies. The case studies were research components of design-oriented projects carried out by the Commonwealth Scientific and Industrial Research Organisation (CSIRO) with aims to inform the design of a collaborative workspace within each domain. The case studies are the empirical contributions of this thesis.

This research has shown that a set of socio-technical factors relating variations in local physical settings, information sharing practices and organizational contexts can influence the dynamics of collaboration across different local settings. The results highlight different kinds and levels of configuration work required in designing collaborative workspaces. These include the careful integration of physical settings with information sharing practices, the appropriate configuration of collaborative workspaces to enable diversity of local practices and the configuration of collaborative workspaces at an organizational level and in the context of coordinative practices. The results of the study have contributed to the development and deployment of an integrated

collaboration platform in a scientific laboratory and have demonstrated that a generic collaborative workspace can be extended by components developed in response to the specific requirements of the work of the local setting. A set of design guidelines has been developed that can be used to guide the design and development of collaborative workspaces which provide coherent collaboration environments across different already existing local settings while respecting the variations within local practices.
